

The Classification of Textured Surfaces Under Varying Illuminant Direction

G. McGunnigle B.Eng.

Thesis submitted
for the
Degree of Doctor of Philosophy

Heriot-Watt University
Department of Computing and Electrical Engineering

June 1998

This copy of the thesis has been supplied on condition that anyone who consults it is understood to recognise that the copyright rests with its author and that no quotation from the thesis and no information derived from it may be published without the prior consent of the author or the University (as may be appropriate).

Table of Contents

Table of Contents.....	i
List of Figures.....	viii
List of Tables.....	xiii
Acknowledgments.....	xiv
Symbols.....	xv
Abstract	xix

Chapter 1 Introduction

1.1 Motivation	1
1.2 Texture Analysis: A Brief Overview	3
1.3 Scope	5
1.4 Original Work.....	6
1.5 Thesis Organisation.....	7

Chapter 2 Modelling Rough Surfaces

2.1 Introduction	10
2.2 Rough Surface Description	11
2.2.1 A Brief Review of Possible Sources of Models.....	11
2.2.2 Single Parameter Description.....	13
2.2.3 Histogram Description.....	14
2.2.4 PSD and ACF.....	16
2.2.5 Relationship between Profile and Surface Spectra	18
2.2.6 Summary	20
2.3 An Admissibility Criterion Based on Phase.....	20
2.3.1 A Phase Condition.....	21
2.3.2 A Simple Test for the Condition	22
2.4 Models of Surface Roughness	27
2.4.1 Modelling Roll-Off.....	27

2.4.2	Modelling Directionality.....	32
2.4.3	Assumptions of the Models.....	35
2.4.4	Summary of the Models.....	36
2.5	Summary of Surface Description and Modelling.....	36
2.5.1	Relevance of this Chapter to subsequent chapters	37
2.6	Conclusions	38

Chapter 3 Image Formation

3.1	Introduction	40
3.2	Modelling the Reflectance Function.....	41
3.2.1	Terms used in this chapter	41
3.2.2	Underlying Physical Processes.....	42
3.2.3	Specular Models.....	44
3.2.4	Diffuse Models.....	45
3.2.5	Summary	53
3.3	An Optimal Linear Model of Image Formation	54
3.3.1	A Linear Filter.....	55
3.3.2	The Signal to Residue Ratio.....	55
3.3.3	The Effect of Surface Characteristics.....	56
3.3.4	Summary	58
3.4	Kube's Model.....	58
3.4.1	An Analytical Expression	58
3.4.2	A Comparison of Kube's Model with the Optimum Linear Model	61
3.4.3	Summary.....	63
3.5	The Effect on Real Textures.....	64
3.5.1	Test Textures and their Spectra.....	64
3.5.2	The Polar Power Distribution	65
3.5.3	Summary	67
3.6	Conclusions	67

Chapter 4 The Imaging Process

4.1	Introduction	69
4.1.1	Noise and Texture.....	69
4.1.2	Organisation of this Chapter	70

4.2	Literature	72
4.2.1	Overview	72
4.2.2	System Optics.....	72
4.2.3	CCD ARRAY	74
4.2.4	Framestore.....	75
4.2.5	Conclusions	77
4.3	The Case for Sub-sampling	78
4.3.1	Introduction.....	78
4.3.2	Justification of Sub-sampling.....	79
4.4	Experimental Investigation.....	81
4.4.1	Introduction.....	81
4.4.2	Transfer Function	82
4.4.3	First Order Statistics of Temporal Noise.....	83
4.4.4	Spectral Characteristics of Temporal Noise	84
4.4.5	Summary	86
4.5	Use of Simulation to Investigate imaging phenomena	87
4.5.1	Quantization Noise	87
4.5.2	The Effect of Jitter.....	88
4.5.3	Serial Filtering.....	89
4.5.4	Summary	90
4.6	Non-Quantifiable Noise Mechanisms	90
4.6.1	Camera Non-linearity	91
4.6.2	Fixed Pattern Noise	92
4.6.3	Summary	93
4.7	An Imaging Model.....	93
4.7.1	Integrating noise components	93
4.7.2	Development of a Noise Engine.....	95
4.8	Assessment of the Physically Based Model of Texture Images.....	97
4.8.1	First Order Statistics	97
4.8.2	Second Order Statistics.....	98
4.9	Conclusions	100

Chapter 5 A Classification System

5.1	Introduction	102
5.2	Terms used in this chapter.....	103
5.3	The Choice of a Texture Measure	104
5.3.1	Wigner Ville Distribution	107
5.3.2	Higher Order Statistics	110
5.3.3	Empirical Techniques	111
5.3.4	Wavelets.....	113
5.3.5	Gabor Functions	117
5.3.6	The Selection of a Measure Set.....	122
5.4	A Classification System	124
5.4.1	Overview	124
5.4.2	Gabor Implementation	124
5.4.3	Post-Processing	129
5.4.4	The Discriminant	135
5.5	Summary	138

Chapter 6 Modelling the Classifier Tilt Response

6.1	Introduction	139
6.2	Modelling The Feature/Tilt Response.....	140
6.2.1	Combined Filter Tilt Response	140
6.2.2	Modelling The Measure Images.....	143
6.2.3	Feature Image Statistics	147
6.3	Testing the theoretical predictions.....	148
6.3.1	Verification by Simulation.....	148
6.3.2	Verification by Experiment.....	151
6.3.3	Summary of Classifier Modelling	156
6.4	The Effect on a Classifier.....	156
6.5	Classification Experiments For Real Textures	159
6.5.1	Test Criteria.....	159
6.5.2	The Data Set.....	159
6.5.3	Experimental Work	161

6.5.4	Summary of results.....	164
6.6	Summary	165

Chapter 7 Addressing the Problem

7.1	Introduction	166
7.2	Review of Chantler's Feature Space Proposals	166
7.2.1	Multiple Training Samples	167
7.2.2	Multiple Discriminants	169
7.2.3	Segmentation/Classification.....	170
7.3	Chantler's Filters.....	170
7.3.1	Review	170
7.3.2	A Texture Specific Filter	174
7.3.3	A General Filter.....	176
7.4	Single Image Shape From Shading Techniques.....	177
7.4.1	Motivation.....	177
7.4.2	Shape From Shading.....	178
7.4.3	Summary	182
7.5	A Model-Based Approach Using Photometric Stereo	183
7.5.1	Model Based Classification.....	183
7.5.2	Photometric Techniques	185
7.6	Conclusions	187

Chapter 8: A Simulation-based Approach to Tilt Effects

8.1	Introduction	189
8.2	Structure of This Chapter	189
8.3	A Photometric Implementation	190
8.3.1	A Review of Developments in Photometric Stereo	190
8.3.2	A Simple Photometric Scheme	193
8.4	Simulation based evaluation.....	194
8.4.1	Experimental Criterion	196
8.4.2	Non-ideal reflectance.....	197
8.4.3	The Effect of Blur	204
8.4.4	The Effect of Temporally Varying Additive Noise	208
8.4.5	Discussion	210

8.5	How well does the technique work on real data?	212
8.5.1	Surface Recovery.....	212
8.5.2	Image Prediction.....	213
8.5.3	Accuracy in the Feature Domain.....	218
8.5.4	Discussion	221
8.6	The Accuracy of Classification	222
8.7	Discussion.....	227
8.8	Conclusions	228

Chapter 9: Summary and Conclusions

9.1	Summary.....	229
9.2	Future Work.....	232
9.3	Conclusions.....	234
	Appendix A: Symbols (arranged alphabetically)	236
	Appendix B: Test Textures	239
	References.....	243

List of Figures

Acknowledgements

I would like to thank my supervisor Dr Mike Chantler, firstly for the opportunity to conduct research, and secondly for his encouragement as well as his willingness to ask awkward questions. I would also like to express my gratitude to Dr. Laurie Linnett whose earlier work fundamentally influenced the approach of this thesis and whose software was critical to this work.

My thanks are also due to Dr. Tariq Khan and Mr Thomas Wyatt whose help in the preparation of this thesis has been invaluable. I am also indebted to the ERASMUS students Tilmann Wittig, Michel Damoiseau and Gregory Delguste for their help and stimulation. I would also like to thank the Chief Technician Alistair Houston who maintained an enthusiastic and helpful attitude to experiments which must have seemed at least slightly bizarre.

Finally, I wish to express my gratitude to my parents whose support, particularly in the last few months, has been vital to the completion of this thesis.

Principal Symbols

Signals

Spatial Quantities		Spectral Quantity	Description
Scalar Field	Vector Field		
$s(x,y)$		$S(u,v)$	Surface Height
	$\mathbf{S}(x,y)$	$P(u,v) \quad Q(u,v)$	Surface Derivatives
	$\mathbf{L}(x,y)$		Illuminant Vector
$i(x,y)$		$I(u,v)$	Incident Image
$d(x,y)$		$D(u,v)$	Measured Data Set
$d_{f,\phi}(x,y)$		$d_{f,\phi}(u,v)$	Output of filter f,ϕ
	$\mathbf{D}(x,y)$		Filter Outputs Vector
$f_{f,\phi}(x,y)$			Feature Response derived from filter f,ϕ
	$\mathbf{F}(x,y)$		Feature Vector
$l(x,y)$			Label field
$n(x,y)$		$N(u,v)$	Noise process
$e(x,y)$		$E(u,v)$	Residue Process

Transfer Functions

Spatial Variable	Spectral Variable	Input	Output	Function
$o(p,q)$		Surface derivative field	Image field	Reflectance function
	$R(u,v)$	Surface height spectrum	Image spectrum	Illumination
$b(x,y)$	$B(u,v)$	Image Spectrum	Data set Spectrum	Imaging
$g(x,y)$	$G_{\omega\phi}(u,v)$	Data Set Spectrum	Output of filter $\omega\phi$	Gabor filter
	$H(u,v)$	Surface spectrum	Measure Spectrum	Combined Filter

Surface Parameters

σ_s	Rms Roughness
R_{cla}	Centre line average
m_{rms}	Rms Slope
p_{rms}	Rms slope in the x-direction
q_{rms}	Rms slope in the y-direction
m_{fg}	f^{th} and g^{th} order statistical moment.
β	Power Roll-off
k	Topothesy
λ_0	Correlation length of an isotropic surface
λ_1	Correlation length in the x-direction
λ_2	Correlation length in the y-direction
ω_0	Fundamental frequency
ω_c	Cut-off frequency

Surface Variables

t	Lag
ω	Radial frequency
θ	Polar frequency angle
u	Horizontal frequency index
v	Vertical frequency index
p	Facet slope in the x-direction
q	Facet slope in the y-direction
p_x	Second derivative of surface, in the x-direction.
q_x	Second derivative of surface, in the x-direction.
$s(x)$	Surface height profile.

$r_c(t)$	Autocorrelation function
$c(t)$	Autocovariance function

Illumination Variables & Parameters

σ	Slant angle
τ	Tilt Angle
$\mathbf{R}$	Correlation matrix of the surface
$\mathbf{V}[\mathbf{a} \ \mathbf{b} \ \mathbf{c}]$	Least squares linear model of the illumination process.
i_d	Desired image
$\mathbf{a} \ \mathbf{b} \ \mathbf{c}$	Parameters of optimal linear model.
$k_1 \ k_2 \ k_3$	Parameters of Kube's linear model.

Imaging Parameters

σ_b	Blur
γ_b	Exponent of camera amplification.
σ_t	Standard deviation of temporal noise.
$\sigma_{\text{disparity}}$	Standard deviation of the difference between two images
σ_n	Standard deviation of overall noise process.

Gabor Filter Parameters

ϕ	Direction of propagation
σ_x	Standard deviation of the Gabor filter envelope in the x-direction.
σ_y	Standard deviation of the Gabor filter envelope in the y-direction.
u_0	Centre frequency of filter in the x-direction.
v_0	Centre frequency of filter in the x-direction.
B_ϕ	Polar bandwidth of the filter.
B_r	Radial frequency bandwidth of the filter.
σ_p	Measured polar bandwidth

σ_p	Standard deviation of the Gabor filter spectrum in the x-direction.
σ_y	Standard deviation of the Gabor filter spectrum in the y-direction.

Feature Parameters

σ_m	Standard deviation of measure image.
μ_r	Mean of Feature image
σ_r	Standard deviation of Feature image.
a	Parameters of feature/tilt model.
b	" "
M_n	Mean vector of class n
Σ_n	Covariance matrix of class n
$p_{F l_i}(F l_i)$	Probability that a vector x belongs to class n
$k(F l_i)$	Probability that a vector x belongs to class n over the entire tilt range.

Symbols Associated with Compensation Schemes

$m(\omega)$	Parameters of Chantler' filters.
$b(\omega)$	" "
i_0, i_{90}, i_{180}	images obtained from $\tau=0^\circ, 90^\circ$ and 180° respectively.
i_{NL}	Non-linear component of surface to image mapping.
i_p	Image which is a linear function of p-derivative field only.
i_q	Image which is a linear function of qderivative field only.

Abstract

This thesis sets texture analysis in a physical context. Models of the system components are obtained from the literature and integrated into a description of the process linking the rough surface to the feature set on which classification is based. The first component is the rough surface, models of the surface topography are selected from the fields of tribology and scattering. Various reflectance models are considered and a spectral model of the surface/image relationship from the literature, is evaluated and discussed. The relationship between the incident image and the captured data set is investigated and described. This model is integrated with the spectral description of the feature measures to form a model of the transition from surface to feature set.

It is clear from this model that the direction of illumination can affect the directionality of an image obtained from a given surface. Changes in the illuminant direction will result in changes in the feature outputs. If the illuminant direction is altered between training and classification, the classification rule may be inappropriate and classification poor. Several schemes are considered to combat this problem. A technique which uses a representation of the physical surface as the basis for the generation of appropriate training data is selected for further evaluation. The surface derivative fields of the training surface are estimated using photometric techniques. A rendering algorithm uses these estimates to simulate the appearance of the training surface when it is illuminated from an arbitrary direction. It is shown that where illuminant direction is varied this system is able to perform significantly better than a naive classifier, and in some cases approaches the level of accuracy obtained from training the classifier under the conditions at which classification is performed.

Texture analysis is a significant area in the field of machine vision, this is in large part due to the important role of texture in the early visual system. It follows from this that texture has been seen as being critical to general visual systems working in unconstrained environments, consequently, less emphasis has been placed on more controlled inspection tasks. In an unconstrained system it is impractical to adopt a modelling approach and most work in texture analysis takes the image as its starting point. This thesis is concerned with the inspection of rough textured surfaces. By making explicit the circumstances under which classification occurs we are able to employ modelling of the system and describe texture classification in the context of the physical system which gives rise to a textured image.
