Joint work with Jie Wen and Torsten Kleinow

IFoA ARC Workshop
2 December 2019
The views expressed in this presentation are those of invited contributors and not necessarily those of the Institute and Faculty of Actuaries (IFoA). The IFoA does not endorse any of the views stated, nor any claims or representations made in this presentation and accept no responsibility or liability to any person for loss or damage suffered as a consequence of their placing reliance upon any view, claim or representation made in this presentation.

The information and expressions of opinion contained in this presentation are not intended to be a comprehensive study, nor to provide actuarial advice or advice of any nature and should not be treated as a substitute for specific advice concerning individual situations. On no account may any part of this presentation be reproduced without the written permission of the IFoA.
Outline

- Background
- Data – England male & female mortality
  - All-cause mortality data
  - Cause-of-death data
  - Predictive variables
Focus for this workshop:
male and female mortality in England

Stylised facts:
- Mortality varies by socio-economic group
- Mortality varies by region
Socio-Economic Differences in Mortality: England

England: mortality by deprivation

Age Standardised Mortality Rates
England by Deprivation Deciles
Males Aged 60–69

Age Standardised Mortality Rates
England by Deprivation Deciles
Females Aged 60–69
Background: Variation By Region

North East
North West
Yorkshire & Humber
East Midlands
West Midlands
East of England
London
South East
South West

Not in dataset: Scotland, Wales, Northern Ireland
Background: Relative mortality by region

England Variation by region (males 60-69)

Values show actual deaths (ages 60-69) by region as a percentage of expected deaths using national age-specific mortality.

Regional variation < variation by income deprivation.
Background

- Mortality varies by socio-economic group
- Mortality in the north (and in big cities) is higher than mortality elsewhere
- *How much of this can be explained by underlying socio-economic differences?*
- *And how much variation is geographical?*

E.g. due to higher or lower levels of smoking than national levels by socio-economic group.
How much data?

- ‘Small’ data
  Deaths and exposures (population) for e.g. the national population (years $\times$ ages)

- ‘Big’ data
  E.g. data at the level of the individual including predictive variables; frequently updated

- ‘Medium’ data
  Data for many small geographical areas including area-specific predictive variables
Data: LSOA’s

- England only
- Lower Layer Super Output Areas: LSOA’s
- $L = 32,844$ small geographical areas
- Socio-economically homogeneous
- Average size $\approx 1600$ persons
- LSOA’s $i = 1, \ldots, L$, single years ($t = 2001-2016$), single ages, $x$, gender, $g$:
  - Deaths: $D(g, i, t, x)$
  - Exposures: $E(g, i, t, x)$ (population)
Data: LSOA’s (cont.)

- About 90% of the $D(g, i, t, x)$ are zero!
- About 6% of the $E(g, i, t, x)$ are zero.
- Exposures are *estimated* from census data at the LSOA level and returned as integers
- 0.6% of the $(g, i, t, x)$ cells for ages 40-89 have $D(g, i, t, x) > 0$ but $E(g, i, t, x) = 0$!

$\Rightarrow$ a problem unless data are aggregated

\[ \sum_{t=t_0}^{t_1}, \quad \sum_{x=x_0}^{x_1}, \quad \sum_{t=t_0}^{t_1} \sum_{x=x_0}^{x_1} \]

or you have a model for errors in the $E(g, i, t, x)$. 
Predictive variables by LSOA

- Indices of Deprivation (2015) (single scores per LSOA)
  - income deprivation (benefits)
  - employment deprivation (unemployment)
  - education deprivation
  - crime
  - barriers to housing and services
    - geographical barriers (distance to services)
    - wider barriers (overcrowding; homelessness; affordability)
    - living environment (housing quality; unmodernised; air quality)

- Educational attainment (levels × age groups)
- Occupation groups (types × age groups)
- Average weekly income
- Average number of bedrooms
- # people in care homes with/without nursing
Predictive variables by LSOA (cont.)

- Proportion UK born
- Country of birth
- Religion
- Ethnic group
- Urban/rural classification (categorical)
- Lookup: Postcode $\rightarrow$ OA $\rightarrow$ LSOA $\rightarrow$ MSOA $\rightarrow$ local authority $\rightarrow$ region
Predictive variables by LSOA (cont.)

1. LSOA index.
   - LSOA codes are of the form “E010xxxxx” where the LSOA index xxxxx ranges from 00001 to 33768.
   - Only 32,844 indexes are currently in use and, therefore, some codes are missing. These are codes that would have been used previously. However, if an LSOA has grown substantially, then it would be split, the old LSOA code deleted, and the two new LSOAs given new codes not yet used. And some LSOAs have shrunk and will have been merged and allocated a new index.

2. Lookup:
   Postcode $\rightarrow$ OA $\rightarrow$ LSOA $\rightarrow$ MSOA $\rightarrow$ local authority $\rightarrow$ region
The Index of Multiple Deprivation (IMD)

Official composite measure of *relative deprivation* in England, with a single value for each LSOA. A higher value indicates a higher level of deprivation. The IMD has seven domains:

- income deprivation;
- employment deprivation;
- education, skills and training;
- health deprivation and disability;
- crime;
- barriers to housing and services;
- living environment.

Some of these have further sub-domains (which we discuss below) that we consider to be useful to refine predictions of mortality.
Income deprivation (a domain of the Index of Multiple Deprivation (IMD)):

- this measures the proportion of the population in each LSOA who are receiving benefits from the state because they are on a low income;
- the data are in a vector of length 32,844: one entry for each LSOA;
- sub-domains include *income deprivation affecting older people*, which measures income deprivation amongst people aged 60 and older.
Employment deprivation (a domain of the IMD)

- this measures the proportion of the *working* population in each LSOA who are unemployed;
- the data are in a vector of length 32,844: one entry for each LSOA corresponding to the vector of 5-digit LSOA codes above.
Predictive variables by LSOA (cont.)

- Living environment deprivation (a domain of the IMD)
  - this measures the quality of the living environment (indoors and outdoors);
  - indoors: (poor) quality of housing;
  - outdoors: e.g. (poor) air quality and traffic accidents;
  - the data are in a vector of length 32,844: one entry for each LSOA.
Barriers to housing and services (a domain of the IMD)

- measures a number of different things: ‘wider barriers’ and ‘geographical barriers’;
- wider barriers includes overcrowding in households, homelessness and affordability of housing;
- geographical barriers measures distance to key services;
- a higher value for geographical barriers ⇒ more ‘deprived’, BUT
- might also imply lower mortality;
- e.g. greater distances to services might indicate that the LSOA is more affluent or rural with housing more spaced out;
in fact, the geographical barriers variable is negatively correlated with income deprivation;

- the data are in a vector of length 32,844: one entry for each LSOA;
- data are available separately for wider barriers and geographical barriers.

Crime

- Measures the risk of personal and material victimisation at local level
Predictive variables by LSOA (cont.)

Predictive variables that are not part of the IMD:

1. **Average number of bedrooms**
   - this measures the average number of bedrooms per household in the LSOA
   - the data vector has been standardised to a $N(0, 1)$ distribution;
   - in contrast to the deprivation indices, a high value (more bedrooms) is likely to be associated with lower mortality;
   - the data are in a vector of length 32,844: one entry for each LSOA.
Highest level of qualification:

- this gives the *proportion* of a particular group within the LSOA who have attained a particular level of education
- data are in the form of a 3-dimensional array for males and females combined
  \[ \text{lsoa} \times \text{age-group} \times \text{education level} \]
- 6 age groups: All; 16 to 24; 25 to 34; 35 to 49; 50 to 64; 65 plus;
- 8 education groups:
  1. All categories: Highest level of qualification
  2. No qualifications
  3. Level 1 qualifications (up to low grade GCSE’s)
  4. Level 2 qualifications (higher grade GCSE’s)
  5. Apprenticeship
Predictive variables by LSOA (cont.)

- Level 3 qualifications (A-level)
- Level 4 qualifications and above (Some college/university qualification, BSc, MSc, ...)
- Other qualifications

- www.gov.uk/
  what-different-qualification-levels-mean/
  list-of-qualification-levels

- you can use the education data to construct one or more vectors of predictive variables: e.g.
  - the proportion of people in the LSOA aged 50-64, who have no qualification or level 1 only;
  - an average level of educational attainment in a particular age group;
Occupation group proportions

- gives the proportion of a particular group within the LSOA who have a particular type of occupation
- data are in the form of a 4-dimensional array
gender × lsoa × age-group × occupation group
(2 × 32, 844 × 14 × 9)
- 14 age groups: All; 16-19; 20-24; 25-29; 30-34; 35-39; 40-44; 45-49; 50-54; 55-59; 60-64; 65-69; 70-74; 35-64
- most age groups are small, so there will be a lot of sampling variation, weakening their predictive ability. This is less of a problem for the 35-64 age group.
9 occupation groups

1. Higher managerial, administrative and professional occupations
2. Lower managerial administrative and professional occupations
3. Intermediate occupations
4. Small employers and own account workers
5. Lower supervisory and technical occupations
6. Semi-routine occupations
7. Routine occupations
8. Never worked, long-term unemployed and full-time students
9. Total

you can use the occupation data to construct one or more vectors of predictive variables
Urban-Rural Classification

1 Conurbation: non London
2 City or town
3 Rural town
4 Rural village and dispersed
5 Conurbation: London

• the data are in a vector of length 32,844: one entry for each LSOA.
Predictive variables by LSOA (cont.)

Region

1. North East
2. North West
3. Yorkshire and Humber
4. East Midlands
5. West Midlands
6. East
7. London
8. South East
9. South West

- the data are in a vector of length 32,844: one entry for each LSOA.
Communal establishments (own commissioned dataset)

- This element of the data (a user-requested dataset from the ONS) records the number of persons in each LSOA in a communal establishment at the time of the 2011 census.
- The data count the number of persons, $C(i, g, y, \tau)$, where
  - $i$ is the LSOA index;
  - $g$ is gender;
  - $y$ is the age group 0-59, and 60+;
  - $\tau$ is the type of communal establishment:
    1. Care home: Private or local authority, with nursing;
    2. Care home: Private or local authority, without nursing;
    3. Remainder of medical and care establishments;
    4. Other communal establishments.
Predictive variables by LSOA (cont.)

7. Proportion of the population that are UK born
8. Proportions of the population in different ethnic groups
   (32 overlapping options)
9. Proportions of the population in different religious groups
   (9 options)
10. Country of birth
11. Average weekly income
12. Proportion of the population working more than 49 hours per week
Plus other LSOA-level user-requested data commissioned from the ONS
e.g. based on 2011 census questionnaire
detail depends on how invasive or sensitive data are

The English Indices of Deprivation 2019 (IoD2019)
Scatterplots of pairs of predictive variables

- E.g. predictive variables \((X_i, Y_i)\), for \(i = 1, \ldots, L = 32844\)
- \(R_{X_i} = \text{rank of } X_i \text{ out of } X_1, \ldots, X_L\)
- \(R_{Y_i} = \text{rank of } Y_i \text{ out of } Y_1, \ldots, Y_L\)
- Scatterplot \((R_{X_i}, R_{Y_i})\) for \(i = 1, \ldots, L = 32844\)
  \(\Rightarrow\) focus on the dependency between \(X\) and \(Y\)
- When choosing which predictive variables to use, avoid pairs that are very highly correlated.

- Scatterplots can be coloured e.g. by urban rural group
  \(\Rightarrow\) insights into what characterises different urban-rural classes
Income Deprivation vs Employment Deprivation

- Conurbation
- Cities
- Rural Towns
- Rural
- London

Rank of Income Deprivation vs Rank of Employment Deprivation

- Conurbation
- Cities
- Rural Towns
- Rural
- London
Income Deprivation Old vs Living Environment

The scatter plot illustrates the relationship between the rank of income deprivation for the elderly (Old) and the rank of living environment. The x-axis represents the rank of income deprivation old, while the y-axis represents the rank of living environment. The data points are color-coded, with different colors indicating different categories or data sets. The distribution of points across the plot provides insights into how income deprivation and living environment rank correlate.
Income Deprivation Old vs Wider Barriers

Rank of Income Deprivation Old

Rank of Wider Barriers (Overcrowding, Homeless, Affordability)

- Conurbation
- Cities
- Rural Towns
- Rural
- London

Rank of Geographical Barriers

Rank of Income Deprivation Old
Income Deprivation Old vs High Educated 65+
UK Born vs High Educated 35-64

![Graph showing the relationship between the rank of proportion UK Born and the rank of proportion High Educated 35-64. The graph is colored by ranks: 1, 2, 3, 4, and 5.]

Andrew J.G. Cairns
Socio-Economic Mortality Data
Cause of death data

- All-cause $\Rightarrow D(g, i, t, x)$ by LSOA
  $\Rightarrow$ lots of 0’s and 1’s
  Not considered to be invasive

- Cause of death:
  small numbers are considered to be invasive/sensitive

- Death counts: $D(g, r, i, c, t, x)$
  - $g$: gender (2)
  - $r$: region (9)
  - $i$: income deprivation decile (10)
  - $c$: cause of death (34)
  - $t$: year (16)
  - $x$: 5-year age groups
Questions to be addressed

- What are good stochastic mortality models for capturing differences between deprivation deciles?
- What are the most significant socio-economic factors that influence mortality rates?
- What other factors push mortality rates up or down at the level of small geographical or regional level?
- Does it make a difference if a neighbourhood is in an urban or rural area?
- After socio-economic and non-spatial effects have been filtered out, what remains in terms of spatial or regional variation in mortality across England.
- How much inequality is there in mortality rates at different ages?
Questions to be addressed (cont.)

- What is the difference between controllable and non-controllable risk factors?
- Which causes of death have significant controllable risk factors?
- Which causes of death have significant levels of mortality inequality?
- What are the contributors to the slowdown in mortality improvements since 2011?
Questions?
