ULTRA, HERIOT-WATT UNIVERSITY, EDINBURGH — December 5, 2001

## Talk's Plan

1. What is HOU?
2. HOU in explicit substitution calculi
3. Unification in the  $\lambda_{s_e}$ -style of explicit substitution
4. Checking arithmetic constraints (versus shifts and composition in  $\lambda\sigma$ )
5. Strategies for  $\lambda_{s_e}$ -unification
6. Translations between the pure  $\lambda$ -calculus and the  $\lambda_{s_e}$ -calculus
7. Related work, Future work and Conclusions

## What is HOU?

- Higher order objects arise naturally in many fields of computer science.
- $\text{MAP}(f, \text{NIL}) \rightarrow \text{NIL}; \text{MAP}(f, \text{CONS}(x, l)) \rightarrow \text{CONS}(f(x), \text{MAP}(f, l))$
- Observe that  $f$  appears both as a variable and as a functional symbol.
- The function `MAP` is a typical example of a second-order function.
- useful third- until sixth-order functions were presented in the context of combinator parsing. In Okasaki'97

## Examples of HOU

- $F(f(a)) = f(F(a))$ .
- Solution is:  $\{F/\lambda_x.x\}$
- Other solutions are:  $\{F(x)/f^n(x) \mid n \in \mathbb{N}\}$ .
- Robinson, Huet ('75)
- Huet's algorithm is a semi-decision one that may never stop when the input unification problem has no unifiers, but when the problem has a solution it always presents an explicit unifier.

## HOU's status

- Unification for second-order logic was proved undecidable in general by Goldfarb in '81.
- Goldfarb's proof is based on a reduction from Hilbert's Tenth Problem.
- For the second-order case, unification is decidable, when the language is restricted to monadic functions (Farmer '88).
- Other problems of HOU include that most general unifiers may not exist.
- Huet has shown that equations of the form  $(\lambda_x.F \ a) =? (\lambda_x.G \ b)$  (called *flex-flex*) of third-order may not have MGUs.

## HOU: Why?

- HOU applied in  $\left\{ \begin{array}{l} - \text{Automated (Higher order) reasoning} \\ - \text{Higher order proof assistants} \\ - \text{Higher order logic programming} \end{array} \right.$
- HOU essential for generalizations of the Robinson's first-order resolution principle.

## HOU: What and Why?

- HOU is equational unification for  $\beta\eta$ -conversion:

$\text{HOU} \left\{ \begin{array}{l} \text{Given two simply-typed lambda terms } a \text{ and } b \\ \text{find a } \textit{substitution} \theta \text{ such that} \\ \theta(a) =_{\beta\eta} \theta(b) \end{array} \right.$
--

- HOU is not first order equational unification (FOU) because substitution has to avoid capture of variables.
- Methods of FOU built on grafting cannot be applied to HOU which needs substitution.
- However, HOU can be reduced to FOU in a suitable theory.

## Why *making substitutions explicit* is adequate for reasoning about HOU?

- First Order Substitution (Grafting) does not rename variables.
- (Higher Order) Substitution renames variables to avoid capture. This complicates the HOU algorithms a lot.
- Grafting cannot replace substitution in  $\lambda$ -calculus: Substitution and reduction commute, grafting and reduction do not commute.
- $((\lambda x.Y)a)$  reduces to  $Y$  but grafting  $x$  for  $Y$  gives  $((\lambda x.x)a)$  which reduces to  $a$  and not  $x$ .

## Why *making substitutions explicit* is adequate for reasoning about HOU?

- Problem comes because of interactions between 2 different calculi:  $\beta\eta$ -conversion and the application of substitution by the unification algorithm
- The variables that can be meaningfully instantiated by unification are never bound variables (i.e. those that can be instantiated by  $\beta\eta$ -reduction).
- Hence, distinguish two kinds of variables and set up a calculus where reduction and unification grafting do not interfere.
- In such a calculus, substituting  $x$  by  $a$  in  $((\lambda x.Y)a)$  must be delayed until the unification variable  $Y$  is instantiated: Use Explicit Substitutions.

## Why *Open Terms*?

- We need two kinds of variables: those of  $\beta\eta$ -conversion and those of unification. Use de Bruijn indices for the first and meta-variables for the second.
- In substitution calculi, grafting and reduction commute. So grafting can be used for unification.
- So, with de Bruijn indices, Open terms and explicit substitution: a HOU problem in  $\lambda$ -calculus translates into a FOU problem of substitution calculus.
- Solutions of the FOU problem can be translated back as solutions in  $\lambda$ -calculus.

- Terms in de Bruijn notation,  $\Lambda_{dB}(\mathcal{X})$ :  $a ::= \mathbb{N} \mid \mathcal{X} \mid (a \ a) \mid \lambda.a$ , where  $\mathcal{X}$  meta-variables and  $\mathbb{N}$  set of de Bruijn indices.

For instance, for the referential  $x, y, z, \dots$ :

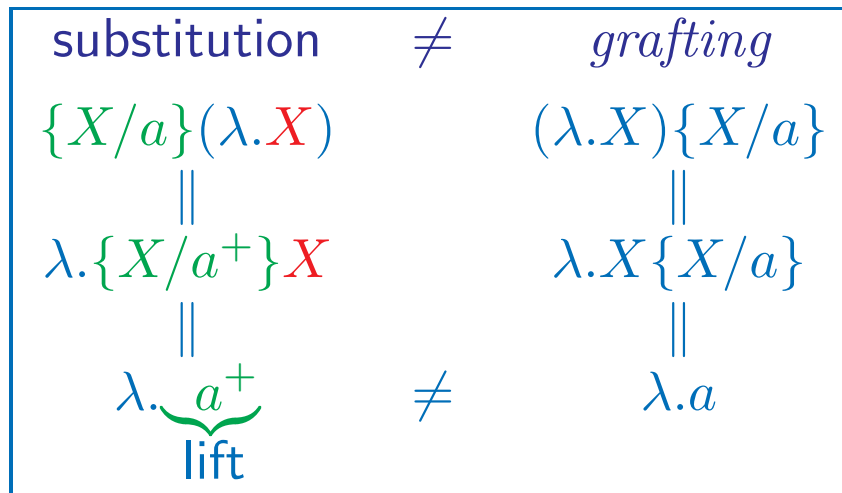

$$\lambda.(\lambda.(4 \ 1) \ (\lambda.(2 \ 1) \ 1))$$

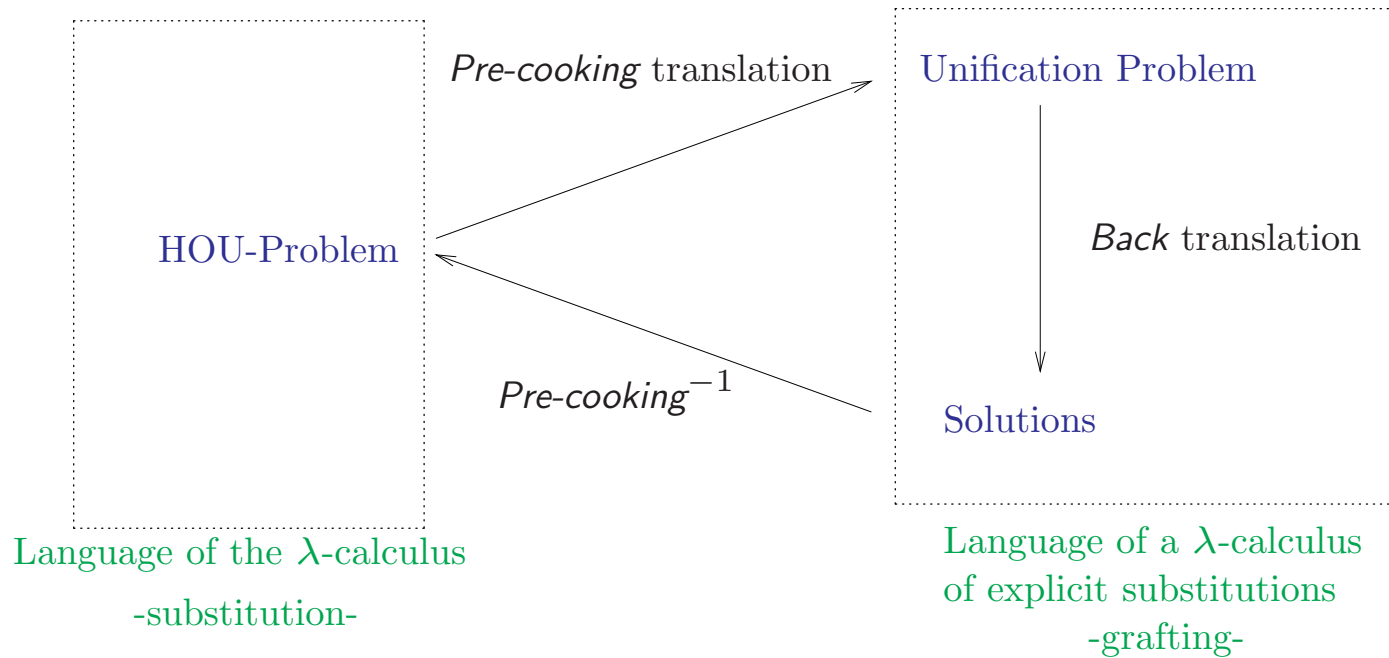

$\beta$ -reduction:

$$\lambda.(\lambda.(4 \ 1) \ (\lambda.(2 \ 1) \ 1)) \rightarrow_{\beta} \lambda.(3 \ (\lambda.(2 \ 1) \ 1)) \rightarrow_{\beta} \lambda.(3 \ (1 \ 1))$$

- Higher order *substitution*:

$$\{X/1\}(\lambda.(1 \ X) \ X) = (\lambda.(1 \ 2) \ 1)$$

- Introduced by G. Dowek, T. Hardin and C. Kirchner using the  $\lambda\sigma$ -calculus.
- Subsumes Huet's HOU method.

## De Bruijn's $\lambda$ -calculus

$a ::= \mathbf{n} \mid X \mid (a \ a) \mid \lambda.a$  where  $X \in \mathcal{X}$  and  $\mathbf{n} \in \mathbb{N} \setminus \{0\}$ .

The *updating functions*  $U_k^i : \Lambda_{dB}(\mathcal{X}) \rightarrow \Lambda_{dB}(\mathcal{X})$  for  $k \geq 0$  and  $i \geq 1$  are defined inductively by:

$$\begin{aligned} U_k^i(a \ b) &= (U_k^i(a) \ U_k^i(b)) \\ U_k^i(\lambda.a) &= \lambda.U_{k+1}^i(a) \\ U_k^i(X) &= X, \quad X \in \mathcal{X} \\ U_k^i(\mathbf{n}) &= \begin{cases} \mathbf{n} + \mathbf{i} - 1 & \text{if } n > k \\ \mathbf{n} & \text{if } n \leq k. \end{cases} \end{aligned}$$

The *meta-substitutions at level  $j$* , for  $j \geq 1$ , of a term  $b \in \Lambda$  in a term  $a \in \Lambda_{dB}(\mathcal{X})$ , denoted  $a\{\{j \leftarrow b\}\}$ , is defined inductively on  $a$  as follows:

$$\begin{aligned}
 (a_1 \ a_2)\{\{j \leftarrow b\}\} &= (a_1\{\{j \leftarrow b\}\} \ a_2\{\{j \leftarrow b\}\}) \\
 (\lambda.a)\{\{j \leftarrow b\}\} &= \lambda.a\{\{j+1 \leftarrow b\}\} \\
 X\{\{j \leftarrow b\}\} &= X, \quad X \in \mathcal{X} \\
 \mathbf{n}\{\{j \leftarrow b\}\} &= \begin{cases} \mathbf{n} - 1 & \text{if } n > j \\ U_0^j(b) & \text{if } n = j \\ \mathbf{n} & \text{if } n < j. \end{cases}
 \end{aligned}$$

## Properties of meta-substitutions and updating

Let  $a, b, c \in \Lambda_{dB}(\mathcal{X})$ . We have:

1. for  $k < n < k + i$ :  $U_k^{i-1}(a) = U_k^i(a) \{\{n \leftarrow b\}\}$ .
2. for  $l \leq k < l + j$ :  $U_k^i(U_l^j(a)) = U_l^{j+i-1}(a)$ .
3. for  $k + i \leq n$ :  $U_k^i(a) \{\{n \leftarrow b\}\} = U_k^i(a \{\{n - i + 1 \leftarrow b\}\})$ .
4. for  $i \leq n$ :  $a \{\{i \leftarrow b\}\} \{\{n \leftarrow c\}\} = a \{\{n + 1 \leftarrow c\}\} \{\{i \leftarrow b \{\{n - i + 1 \leftarrow c\}\}\}\}$ .
5. for  $l + j \leq k + 1$ :  $U_k^i(U_l^j(a)) = U_l^j(U_{k+1-j}^i(a))$ .
6. for  $n \leq k + 1$ :  $U_k^i(a \{\{n \leftarrow b\}\}) = U_{k+1}^i(a) \{\{n \leftarrow U_{k-n+1}^i(b)\}\}$ .

## beta and eta rules

- ( $\beta$ -rule)  $(\lambda.a \ b) \rightarrow_{\beta} a\{\{1 \leftarrow b\}\}$
- ( $\eta$ -rule)  $\lambda.(a \ 1) \rightarrow_{\eta} b$  if  $\exists b \ U_0^2(b) = a$

## $\lambda s_e$ calculus

- Terms in  $\lambda s_e$ :  $a ::= \mathcal{X} \mid \mathbb{N} \mid (a \ a) \mid \lambda.a \mid a\sigma^j a \mid \varphi_k^i a$ , for  $j, i \geq 1, k \geq 0$   
where  $\mathcal{X}$  *meta-variables* and  $\mathbb{N}$  set of de Bruijn indices.

Table 1: The Rewriting System of the  $\lambda_s$ -calculus with  $\eta$ -rule

<i>(<math>\sigma</math>-generation)</i>	$(\lambda.a \ b)$	$\longrightarrow$	$a \sigma^1 b$
<i>(<math>\sigma</math>-<math>\lambda</math>-transition)</i>	$(\lambda.a) \sigma^i b$	$\longrightarrow$	$\lambda.(a \sigma^{i+1} b)$
<i>(<math>\sigma</math>-app-transition)</i>	$(a_1 \ a_2) \sigma^i b$	$\longrightarrow$	$((a_1 \sigma^i b) \ (a_2 \sigma^i b))$
<i>(<math>\sigma</math>-destruction)</i>	$\mathbf{n} \sigma^i b$	$\longrightarrow$	$\begin{cases} \mathbf{n} - 1 & \text{if } n > i \\ \varphi_0^i b & \text{if } n = i \\ \mathbf{n} & \text{if } n < i \end{cases}$
<i>(<math>\varphi</math>-<math>\lambda</math>-transition)</i>	$\varphi_k^i(\lambda.a)$	$\longrightarrow$	$\lambda.(\varphi_{k+1}^i a)$
<i>(<math>\varphi</math>-app-transition)</i>	$\varphi_k^i(a_1 \ a_2)$	$\longrightarrow$	$((\varphi_k^i a_1) \ (\varphi_k^i a_2))$
<i>(<math>\varphi</math>-destruction)</i>	$\varphi_k^i \mathbf{n}$	$\longrightarrow$	$\begin{cases} \mathbf{n} + i - 1 & \text{if } n > k \\ \mathbf{n} & \text{if } n \leq k \end{cases}$
<i>(Eta)</i>	$\lambda.(a \ \mathbf{1})$	$\longrightarrow$	$b \quad \text{if } a =_s \varphi_0^2 b$

Table 2: The Rewriting System of the  $\lambda_{s_e}$ -calculus without rules in Table 1

<i>(<math>\sigma</math>-<math>\sigma</math>-transition)</i>	$(a\sigma^i b)\sigma^j c$	$\longrightarrow$	$(a\sigma^{j+1} c)\sigma^i (b\sigma^{j-i+1} c)$	if $i \leq j$
<i>(<math>\sigma</math>-<math>\varphi</math>-transition 1)</i>	$(\varphi_k^i a)\sigma^j b$	$\longrightarrow$	$\varphi_k^{i-1} a$	if $k < j < k + 1$
<i>(<math>\sigma</math>-<math>\varphi</math>-transition 2)</i>	$(\varphi_k^i a)\sigma^j b$	$\longrightarrow$	$\varphi_k^i (a\sigma^{j-i+1} b)$	if $k + i \leq j$
<i>(<math>\varphi</math>-<math>\sigma</math>-transition)</i>	$\varphi_k^i (a\sigma^j b)$	$\longrightarrow$	$(\varphi_{k+1}^i a)\sigma^j (\varphi_{k+1-j}^i b)$	if $j \leq k + 1$
<i>(<math>\varphi</math>-<math>\varphi</math>-transition 1)</i>	$\varphi_k^i (\varphi_l^j a)$	$\longrightarrow$	$\varphi_l^j (\varphi_{k+1-j}^i a)$	if $l + j \leq k$
<i>(<math>\varphi</math>-<math>\varphi</math>-transition 2)</i>	$\varphi_k^i (\varphi_l^j a)$	$\longrightarrow$	$\varphi_l^{j+i-1} a$	if $l \leq k < l + 1$

## Origins of $\lambda_{s_e}$ -calculus

- ( $\sigma$ -generation rule:)

$$(t_1\delta)(t_2\lambda) \rightarrow_{\sigma} (t_1\delta)(t_2\lambda)(t_1\sigma^{(1)})$$

- ( $\sigma$ -transition rules:)

$$\begin{aligned} (t_1\sigma^{(i)})(t_2\lambda) &\rightarrow_{\sigma} ((t_1\sigma^{(i)})t_2\lambda)(t_1\sigma^{(i+1)}) && (\sigma_{01\lambda} - \text{transition}) \\ (t_1\sigma^{(i)})(t_2\delta) &\rightarrow_{\sigma} ((t_1\sigma^{(i)})t_2\delta)(t_1\sigma^{(i)}) && (\sigma_{01\delta} - \text{transition}) \end{aligned}$$

- ( $\sigma$ -destruction rules:)

$$(t_1\sigma^{(i)})i \rightarrow_{\sigma} \text{ud}^{(i)}(t_1)$$

$$(t_1\sigma^{(i)})x \rightarrow_{\sigma} x \text{ if } x \neq i.$$

# $\lambda\sigma$ -calculus

- TERMS  $a ::= 1 \mid X \mid (a \ a) \mid \lambda a \mid a[s]$

- SUBS  $s ::= id \mid \uparrow \mid a.s \mid s \circ s.$

Table 3: The  $\lambda\sigma$  Rewriting System of the  $\lambda\sigma$ -calculus

<i>(Beta)</i>	$(\lambda.a \ b)$	$\longrightarrow$	$a [b \cdot id]$
<i>(Id)</i>	$a[id]$	$\longrightarrow$	$a$
<i>(VarCons)</i>	$\mathbf{1} [a \cdot s]$	$\longrightarrow$	$a$
<i>(App)</i>	$(a \ b)[s]$	$\longrightarrow$	$(a [s]) (b [s])$
<i>(Abs)</i>	$(\lambda.a)[s]$	$\longrightarrow$	$\lambda.a [\mathbf{1} \cdot (s \circ \uparrow)]$
<i>(Clos)</i>	$(a [s])[t]$	$\longrightarrow$	$a [s \circ t]$
<i>(IdL)</i>	$id \circ s$	$\longrightarrow$	$s$
<i>(IdR)</i>	$s \circ id$	$\longrightarrow$	$s$
<i>(ShiftCons)</i>	$\uparrow \circ (a \cdot s)$	$\longrightarrow$	$s$
<i>(Map)</i>	$(a \cdot s) \circ t$	$\longrightarrow$	$a [t] \cdot (s \circ t)$
<i>(Ass)</i>	$(s \circ t) \circ u$	$\longrightarrow$	$s \circ (t \circ u)$
<i>(VarShift)</i>	$\mathbf{1} \cdot \uparrow$	$\longrightarrow$	$id$
<i>(SCons)</i>	$\mathbf{1}[s] \cdot (\uparrow \circ s)$	$\longrightarrow$	$s$
<i>(Eta)</i>	$\lambda.(a \ \mathbf{1})$	$\longrightarrow$	$b$ if $a =_{\sigma} b[\uparrow]$

## Unification in the $\lambda_{se}$ -style of explicit substitution

- A  $\lambda_{se}$ -unification problem  $P$  is: 
$$\left\{ \begin{array}{l} \forall_{j \in J} \underbrace{\exists \vec{w}_j \bigwedge_{i \in I_j} s_i =_{\lambda_{se}}^? t_i}_{\text{unification system}} \end{array} \right.$$

- A **unifier** of  $\underbrace{\exists \vec{w} \bigwedge_{i \in I} s_i =_{\lambda_{se}}^? t_i}_{\text{unification system}}$  is a **grafting**  $\sigma$  such that  $\boxed{\exists \vec{w} \bigwedge_{i \in I} s_i \sigma = t_i \sigma}$

- $\vec{w}$  are called **bound** and denoted  $Bvar(P)$ .

## Unification rules

Table 4: The Boolean simplification rules for unification problems

<i>(Trivial)</i>	$P \wedge s =? s \rightarrow P$
<i>(AndIdem)</i>	$P \wedge e \wedge e \rightarrow P \wedge e$
<i>(OrIdem)</i>	$P \vee e \vee e \rightarrow P \vee e$
<i>(SimpAndT)</i>	$P \wedge \mathbb{T} \rightarrow P$
<i>(SimpAndF)</i>	$P \wedge \mathbb{F} \rightarrow \mathbb{F}$
<i>(SimpOrT)</i>	$P \vee \mathbb{T} \rightarrow \mathbb{T}$
<i>(SimpOrF)</i>	$P \vee \mathbb{F} \rightarrow P$
<i>(Distrib)</i>	$P \wedge (Q \vee R) \rightarrow (P \wedge Q) \vee (P \wedge R)$
<i>(Propag)</i>	$\exists \vec{z}(P \vee Q) \rightarrow \exists \vec{z}P \vee \exists \vec{z}Q$
<i>(ElimQE)</i>	$\exists z P \rightarrow P, \text{ if } z \notin \text{var}(P)$
<i>(ElimBV)</i>	$\exists z \ z =? t \wedge P \rightarrow P, \text{ if } z \notin \text{var}(P) \cup \text{var}(t)$

## $\eta$ -long normal forms

- $\eta$ -long normal forms guarantee that meta-variables of functional type  $A \rightarrow B$  are instantiated with typed  $\lambda_{s_e}$ -terms of the form  $\lambda_A.a$ .
- Let  $a$  be a  $\lambda_{s_e}$ -term of type  $A_1 \rightarrow \dots \rightarrow A_n \rightarrow B$  in the environment  $\Gamma$  and in  $\lambda_{s_e}$ -normal form. The  **$\eta$ -long normal form** of  $a$ , written  $a'$ , is defined by:
  1. if  $a = \lambda_C.b$  then  $a' = \lambda_C.b'$
  2. if  $a = (b_1 \dots b_p)$  then  $a' = \lambda_{A_1} \dots \lambda_{A_n} (c_1 \dots c_p \mathbf{n}' \dots \mathbf{1}')$ , where  $c_i$  is the  $\eta$ -long normal form of the normal form of  $\varphi_0^{n+1}b_i$
  3. if  $a = b\sigma^i c$  then  $a' = \lambda_{A_1} \dots \lambda_{A_n} (d'\sigma^{i+n}e' \mathbf{n}' \dots \mathbf{1}')$ , where  $d', e'$  are the  $\eta$ -long normal forms of the normal forms of  $\varphi_0^{n+1}b$  and  $\varphi_0^{n+1}c$ , respectively
  4. if  $a = \varphi_k^i b$  then  $a' = \lambda_{A_1} \dots \lambda_{A_n} (\varphi_k^i c' \mathbf{n}' \dots \mathbf{1}')$ , where  $c'$  is the  $\eta$ -long normal form of the normal form of  $\varphi_0^{n+1}b$
- The **long normal form** of a  $\lambda_{s_e}$ -term is the  $\eta$ -long normal form of its  $\beta\eta$ -normal form.

A unification system  $P$  is a  $\lambda_{se}$ -**solved form** if all its meta-variables are of atomic type and it is a conjunction of non trivial equations of the following forms:

*(Solved)*  $X =_{\lambda_{se}}^? a$ , where the variable  $X$  does not occur anywhere else in  $P$  and  $a$  is in long normal form. Both  $X$  and  $X =_{\lambda_{se}}^? a$  are said to be **solved** in  $P$ .

*Flex-Flex)* unsolved equations between long normal terms whose leading operator are  $\sigma$  or  $\varphi$  which can be represented as equations between their skeleton:  
 $\psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p) =_{\lambda_{se}}^? \psi_{k_q}^{l_q} \dots \psi_{k_1}^{l_1}(Y, b_1, \dots, b_q)$  with  $X, Y$  of atomic type.

Table 5: The  $\lambda_{se}$ -unification rules

$(Dec-\lambda)$	$P \wedge \lambda_A.a =_{\lambda_{se}}^? \lambda_A.b \rightarrow P \wedge a =_{\lambda_{se}}^? b$
$(Dec-App)$	$P \wedge (\mathbf{n} a_1 \dots a_p) =_{\lambda_{se}}^? (\mathbf{n} b_1 \dots b_p) \rightarrow P \wedge_{i=1..p} a_i =_{\lambda_{se}}^? b_i$
$(App-Fail)$	$P \wedge (\mathbf{n} a_1 \dots a_p) =_{\lambda_{se}}^? (\mathbf{m} b_1 \dots b_q) \rightarrow \mathbb{F}$ if $\mathbf{n} \neq \mathbf{m}$
$(Dec-\sigma)$	$P \wedge a\sigma^i b =_{\lambda_{se}}^? c\sigma^i d \rightarrow P \wedge a =_{\lambda_{se}}^? c \wedge b =_{\lambda_{se}}^? d$
$(\sigma-Fail)$	$P \wedge a\sigma^i b =_{\lambda_{se}}^? c\sigma^j d \rightarrow \mathbb{F}$ if $i \neq j$ and $a\sigma^i b =_{\lambda_{se}}^? c\sigma^j d$ is not <i>flex-flex</i>
$(Dec-\varphi)$	$P \wedge \varphi_k^i a =_{\lambda_{se}}^? \varphi_k^i b \rightarrow P \wedge a =_{\lambda_{se}}^? b$
$(\varphi-Fail)$	$P \wedge \varphi_k^i a =_{\lambda_{se}}^? \varphi_l^j b \rightarrow \mathbb{F}$ if $i \neq j$ or $k \neq l$ and $\varphi_k^i a =_{\lambda_{se}}^? \varphi_l^j b$ is not <i>flex-flex</i>
$(Exp-\lambda)$	$P \rightarrow \exists(Y \text{ where } A.\Gamma \vdash Y : B), P \wedge X =_{\lambda_{se}}^? \lambda_A.Y$ if $(\Gamma \vdash X : A \rightarrow B) \in \mathcal{T}var(P), Y \notin \mathcal{T}var(P)$ , and $X$ is a unsolved variable

Table 6: The  $\lambda_{se}$ -unification rules

$$\begin{aligned}
 (Exp-App) \quad & P \wedge \psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p) =_{\lambda_{se}}^? (\mathbf{m} b_1 \dots b_q) \quad \rightarrow \\
 & P \wedge \psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p) =_{\lambda_{se}}^? (\mathbf{m} b_1 \dots b_q) \quad \wedge \\
 & \quad \bigvee_{r \in R_p \cup R_i} \exists H_1, \dots, H_k, X =_{\lambda_{se}}^? (\mathbf{r} H_1 \dots H_k)
 \end{aligned}$$

- if  $\psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p)$  is the skeleton of a  $\lambda_{se}$ -normal term
- $X$  has an atomic type and is not solved
- $H_1, \dots, H_k$  are variables of appropriate types, not occurring in  $P$ , with the environments  $\Gamma_{H_i} = \Gamma_X$
- $R_p \subseteq \{i_1, \dots, i_p\}$  of superscripts of the  $\sigma$  operator such that  $(\mathbf{r} H_1 \dots H_k)$  has the right type  $R_i = \begin{cases} \bigcup_{j=0}^p \{q\} & \text{if } q > i_{k+1} \\ \emptyset & \text{otherwise} \end{cases}$

and  $q = m + p - k - \sum_{l=k+1}^p j_l$ ,  $i_0 = \infty$ ,  $i_{p+1} = 0$

Table 7: The  $\lambda_{se}$ -unification rules

<i>(Replace)</i>	$P \wedge X =_{\lambda_{se}}^? a \quad \rightarrow \quad \{X/a\}P \wedge X =_{\lambda_{se}}^? a$ <p>if <math>X \in \mathcal{T}var(P)</math>, <math>X \notin \mathcal{T}var(a)</math> and <math>a \in \mathcal{X} \Rightarrow a \in \mathcal{T}var(P)</math></p>
<i>(Normalize)</i>	$P \wedge a =_{\lambda_{se}}^? b \quad \rightarrow \quad P \wedge a' =_{\lambda_{se}}^? b'$ <p>if <math>a</math> or <math>b</math> is not in long normal form,</p> $a' = \begin{cases} \text{the long normal form of } a & \text{if } a \text{ is an unsolved variable} \\ a & \text{otherwise} \end{cases}$ <p><math>b'</math> is defined from <math>b</math> similarly to <math>a'</math> from <math>a</math>.</p>

<b>Example :</b>	$(\lambda.(\lambda.(X \ 2) \ 1) \ Y)$	$=_{\lambda_{se}}^?$	$(\lambda.(Z \ 1) \ U)$
<i>Normalize</i>	$((X \sigma^2 Y) \sigma^1 (\varphi_0^1 Y) \ \varphi_0^1 Y)$	$\downarrow$	$X, Z : A \rightarrow A; Y, U : A$
<i>Dec-App</i>	$(X \sigma^2 Y) \sigma^1 (\varphi_0^1 Y) =_{\lambda_{se}}^? Z \sigma^1 U$	$=_{\lambda_{se}}^?$	$(Z \sigma^1 U \ \varphi_0^1 U)$
<i>Dec-<math>\varphi</math></i>	$(X \sigma^2 Y) \sigma^1 (\varphi_0^1 Y) =_{\lambda_{se}}^? Z \sigma^1 U$	$\downarrow$	$\varphi_0^1 Y =_{\lambda_{se}}^? \varphi_0^1 U$
<i>Replace</i>	$(X \sigma^2 Y) \sigma^1 (\varphi_0^1 Y) =_{\lambda_{se}}^? Z \sigma^1 Y$	$\downarrow$	$Y =_{\lambda_{se}}^? U$
<i>Exp-<math>\lambda</math> + Replace</i>	$((\lambda.X') \sigma^2 Y) \sigma^1 (\varphi_0^1 Y) =_{\lambda_{se}}^? (\lambda.Z') \sigma^1 Y$	$\downarrow^*$	$\wedge \left\{ \begin{array}{l} Y =_{\lambda_{se}}^? U \\ X =_{\lambda_{se}}^? \lambda.X' \\ Z =_{\lambda_{se}}^? \lambda.Z' \end{array} \right.$
<i>Normalize + Dec-<math>\lambda</math></i>	$(X' \sigma^3 Y) \sigma^2 (\varphi_0^1 Y) =_{\lambda_{se}}^? Z' \sigma^2 Y$	$\downarrow^*$	$\wedge \left\{ \begin{array}{l} Y =_{\lambda_{se}}^? U \\ X =_{\lambda_{se}}^? \lambda.X' \\ Z =_{\lambda_{se}}^? \lambda.Z' \end{array} \right.$

- *Solved* equations:  $\left\{ \begin{array}{l} Y =_{\lambda_{se}}^? U \\ X =_{\lambda_{se}}^? \lambda.X' \\ Z =_{\lambda_{se}}^? \lambda.Z' \end{array} \right\}$  *Solved Forms*
- *Flex-Flex* equations:  $(X'\sigma^3Y)\sigma^2(\varphi_0^1Y) =_{\lambda_{se}}^? Z'\sigma^2Y$

- Solutions:  $\{Y/X_1, U/X_1\} \cup$  solutions for  $X$  and  $Z$  given by the *Flex-Flex* equation.

Take, for instance,  $\{Y/X_1, U/X_1\} \cup \{X/\lambda.n + 1, Z/\lambda.n\}$  with  $n > 2$ :

$$\underline{(\lambda.(\lambda.(\lambda.n + 1 \ 2) \ 1) \ X_1)} \rightarrow_{\beta} (\lambda.(\lambda.n \ 2) \ X_1) \rightarrow_{\beta} (\lambda.n - 1 \ X_1) \rightarrow_{\beta} \underline{n - 2}$$

and

$$\underline{(\lambda.(\lambda.n \ 1) \ X_1)} \rightarrow_{\beta} (\lambda.n - 1 \ X_1) \rightarrow_{\beta} \underline{n - 2}$$

- Correctness: If  $P$  reduces to  $P'$  then every unifier of  $P'$  is a unifier of  $P$ .
- Completeness: If  $P$  reduces to  $P'$  then every unifier of  $P$  is a unifier of  $P'$ .

### **Theorem** [Correctness and Completeness]

The  $\lambda s_e$ -unification rules are correct and complete.

### 3. Checking arithmetic constraints (versus shifts and composition in $\lambda\sigma$ )

*Exp-App*  $\lambda\sigma$ -unification rule

$$P \wedge X[a_1 \dots a_p. \uparrow^n] =_{\lambda\sigma}^? (\mathfrak{m} b_1 \dots b_q) \rightarrow$$

$$\wedge \begin{cases} P \\ X[a_1 \dots a_p. \uparrow^n] =_{\lambda\sigma}^? (\mathfrak{m} b_1 \dots b_q) \\ \bigvee_{r \in R_p \cup R_i} \exists H_1 \dots H_k, X =_{\lambda\sigma}^? (\mathfrak{r} H_1 \dots H_k) \end{cases}$$

$X$  not solved and atomic;  $H_1, \dots, H_k$  variables of appropriate types;  
 $\Gamma_{H_i} = \Gamma_X$ ,  $R_p \subseteq \{1, \dots, p\}$  such that  $(\mathfrak{r} H_1 \dots H_k)$  has the right type,  
 $R_i =$  if  $m \geq n + 1$  then  $\{m - n + p\}$  else  $\emptyset$

### *Exp-App* $\lambda_{se}$ -unification rule

$$P \wedge \psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p) =_{\lambda_{se}}^? (\mathbf{m} b_1 \dots b_q) \rightarrow$$

$$\wedge \left\{ \begin{array}{l} P \\ \psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p) =_{\lambda_{se}}^? (\mathbf{m} b_1 \dots b_q) \\ \bigvee_{r \in R_p \cup R_i} \exists H_1, \dots, H_k, X =_{\lambda_{se}}^? (\mathbf{r} H_1 \dots H_k) \end{array} \right.$$

$\psi_{i_p}^{j_p} \dots \psi_{i_1}^{j_1}(X, a_1, \dots, a_p)$  skeleton of a  $\lambda_{se}$ -normal term;  $X$  atomic and not solved;  $\Gamma_{H_i} = \Gamma_X$ ,  $R_p \subseteq \{i_1, \dots, i_p\}$  of superscripts of the  $\sigma$  operator such that  $(\mathbf{r} H_1 \dots H_k)$  has the right type,  $R_i = \bigcup_{k=0}^p$  if  $i_k \geq m + p - k - \sum_{l=k+1}^p j_l > i_{k+1}$  then  $\{m + p - k - \sum_{l=k+1}^p j_l\}$  else  $\emptyset$ , where  $i_0 = \infty, i_{p+1} = 0$

## In the $\lambda\sigma$ -calculus

$X[a_1 \dots a_p. \uparrow^n] =_{\lambda\sigma}^? (\mathfrak{m} b_1 \dots b_q)$  has solutions of the form:

$$\left( \underbrace{1[\uparrow \circ \dots \circ \uparrow]}_{r-1} \quad \underbrace{H_1 \dots H_k}_{\text{of appropriate type}} \right)$$

$$\underbrace{1[\uparrow \circ \dots \circ \uparrow]}_{r-1} [a_1 \dots a_p. \uparrow^n] = \begin{cases} a_i, & \text{if } 1 \leq r = i \leq p \\ \underbrace{1[\uparrow \circ \dots \circ \uparrow]}_{r-1-p} \quad \underbrace{[\uparrow \circ \dots \circ \uparrow]}_n & \textit{otherwise.} \end{cases}$$

## In the $\lambda_{se}$ -calculus

$$\psi_{k_p}^{j_p} \dots \psi_{k_1}^{j_1}(X, a_1, \dots, a_p) \stackrel{?}{=}_{\lambda_{se}} (m \ b_1 \ \dots \ b_q) \text{ solutions of the form:}$$

$$\left( \mathbf{n} \ \underbrace{H_1 \ \dots \ H_k}_{\text{of appropriate type}} \right)$$

such that for some  $i$ ,

$$\left[ \begin{array}{c} k_{i+1} < n \leq k_i \\ \text{and} \\ n - (p - i) + \sum_{r=i+1}^p j_r = m \end{array} \right]$$

## 4. Translations between the pure $\lambda$ -calculus and the $\lambda_{se}$ -calculus

- A unifier of  $\lambda.X =_{\beta\eta} \lambda.a$  is not a  $\{X/b\}$  such that  $b =_{\beta\eta} a$ :

$$\{X/b\}(\lambda.X) = \lambda.(\{X/b^+\}X) = \lambda.(X\{X/b^+\}) = \lambda.b^+$$

- The **pre-cooking** of a  $\lambda$ -term in de Bruijn notation into the  $\lambda_{se}$ -calculus is defined by  $a_{pc} = PC(a, 0)$  where  $PC(a, n)$  is defined by:

1.  $PC(\lambda_B.a, n) = \lambda_B.PC(a, n + 1)$
2.  $PC((a \ b), n) = (PC(a, n) \ PC(b, n))$
3.  $PC(\mathbf{k}, n) = \mathbf{k}$
4.  $PC(X, n) = \begin{cases} \text{if } n = 0 \text{ then } X \\ \text{else } \varphi_0^{n+1} X \end{cases}$

**Proposition**[Semantics of pre-cooking]

$$\underbrace{(\{X_1/b_1, \dots, X_p/b_p\}(a))_{pc}}_{\text{Substitution}} = \underbrace{a_{pc}\{X_1/b_{1pc}, \dots, X_p/b_{ppc}\}}_{\text{Grafting}}$$

**Proposition**[Correspondence between solutions]

$$\exists N_1, \dots, N_p \underbrace{\{X_1/N_1, \dots, X_p/N_p\}(a)}_{\text{substitution}} =_{\beta\eta} \underbrace{\{X_1/N_1, \dots, X_p/N_p\}(b)}_{\text{substitution}}$$

$\iff$

$$\exists M_1, \dots, M_p \underbrace{a_{pc}\{X_1/M_1, \dots, X_p/M_p\}}_{\text{grafting}} =_{\lambda_{se}} \underbrace{b_{pc}\{X_1/M_1, \dots, X_p/M_p\}}_{\text{grafting}}$$

## 5. A simple example

Problem:  $\lambda.(X \ 2) =_{\beta\eta}^? \lambda.2, \quad 2 : A, \quad X : A \rightarrow A$

$$\begin{aligned}
 \lambda.(\varphi_0^2(X) \ 2) &=_{\lambda_{se}}^? \lambda.2 && \rightarrow \text{Dec-}\lambda \\
 (\varphi_0^2(X) \ 2) &=_{\lambda_{se}}^? 2 && \rightarrow \text{Exp-}\lambda \\
 \exists Y (\varphi_0^2(X) \ 2) &=_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.Y && \rightarrow \text{Replace} \\
 \exists Y (\varphi_0^2(\lambda.Y) \ 2) &=_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.Y && \rightarrow \text{Normalize} \\
 \exists Y (\varphi_1^2 Y) \sigma^1 2 &=_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.Y && \rightarrow \text{Exp-app} \\
 (\exists Y (\varphi_1^2 Y) \sigma^1 2 =_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.Y) &\wedge (Y =_{\lambda_{se}}^? 1 \vee Y =_{\lambda_{se}}^? 2) && \rightarrow \text{Replace} \\
 ((\varphi_1^2 1) \sigma^1 2 =_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.1) &\vee ((\varphi_1^2 2) \sigma^1 2 =_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.2) && \rightarrow \text{Normalize} \\
 (2 =_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.1) &\vee (2 =_{\lambda_{se}}^? 2 \wedge X =_{\lambda_{se}}^? \lambda.2) && \equiv \\
 (X =_{\lambda_{se}}^? \lambda.1) &\vee (X =_{\lambda_{se}}^? \lambda.2) && 
 \end{aligned}$$

Problem:  $\lambda.(X \ 2) \stackrel{?}{=}_{\beta\eta} \lambda.2, \quad 2 : A, \quad X : A \rightarrow A$

Solutions:  $\left\{ \begin{array}{l} \{X/\lambda.1\} \\ \{X/\lambda.2\} \end{array} \right.$

Note that we have:

$$\begin{aligned} \{X/\lambda.1\}(\lambda.(X \ 2)) &= \lambda.(\{X/(\lambda.1)^+\}(X) \ 2) = \\ &= \lambda.(\lambda.1^{+1} \ 2) = \lambda.(\lambda.1 \ 2) =_{\beta} \lambda.2 \end{aligned}$$

and

$$\begin{aligned} \{X/\lambda.2\}(\lambda.(X \ 2)) &= \lambda.(\{X/(\lambda.2)^+\}(X) \ 2) = \\ &= \lambda.(\lambda.2^{+1} \ 2) = \lambda.(\lambda.3 \ 2) =_{\beta} \lambda.2 \end{aligned}$$

## 6. Related work

Our development of the  $\lambda_{s_e}$ -HOU was based on the ones of Dowek, Hardin and Kirchner for the  $\lambda\sigma$ -calculus of explicit substitutions.

One of our motivations was, in the practical setting of HOU, to compare the advantages and disadvantages of the two styles of explicit substitutions. This provides objective facts about that interesting theoretical question.

We think that our method can be adapted for applications in/for systems as the  $\lambda$ Prolog, Maude and ELAN.

Additional facts about the *back* transformation and practical considerations for an eventual implementation are available in Ayala-Rincón & Kamareddine “*On Applying  $\lambda_{s_e}$ -Style of Unification for Simply-Typed Higher Order Unification in the Pure  $\lambda$ -Calculus*” at <http://www.cee.hw.ac.uk/ultra/pubs.html>.

## 7. Future work and Conclusions

To be done {

- Prototype implementation.
- Comparison with the *suspension* calculus.

- $\lambda\sigma$ -(HO)Unification and  $\lambda_{s_e}$ -(HO)Unification strategies don't differ.
- Pre-cooking (and back) translations in  $\lambda\sigma$  and  $\lambda_{s_e}$  differ:
  - A simple selection of the scripts for the operators  $\varphi$  and  $\sigma$  in  $\lambda_{s_e}$  corresponds to the manipulation of substitution objects in the  $\lambda\sigma$ -HOU approach.
  - Use of all de Bruijn indices makes our approach simpler.
