

F28HS Hardware-Software Interface: Systems Programming

Hans-Wolfgang Loidl

School of Mathematical and Computer Sciences,
Heriot-Watt University, Edinburgh

Semester 2 — 2019/20

⁰No proprietary software has been used in producing these slides

Outline

- 1 Tutorial 1: Using Python and the Linux FS for GPIO Control
- 2 Tutorial 2: Programming an LED
- 3 **Tutorial 3: Programming a Button input device**
- 4 Tutorial 4: Inline Assembler with gcc
- 5 Tutorial 5: Programming an LCD Display
- 6 Tutorial 6: Performance Counters on the RPi 2

Tutorial 3: Programming a Button input device

- In this tutorial we want to use a button, connected through a breadboard as an input device.
- This is the simplest input device that we will cover.
- The code needed to control is typical for such devices.
- This tutorial deals with **programming a button as input device**.

Core Techniques

- In the LED tutorial, we have seen that we first need to **identify the registers** that give control to the device.
- For that we will again look into the **BCM Peripherals** documentation.
- We will then go through a simple example of
 - ▶ reading button input data,
 - ▶ blinking an LED on button press.
- We want to connect the button with **pin 24**, using a breadboard.
- These simple activities, will also be at the core of CW2.

GPIO Register Assignment

Registers

Write into these bits (12–14) to set the **function** for pin 24

BCM2835 GPIO Peripherals

Base address: 0x3F000000

| | | |
|-----|--------|------------------------------|
| 0 | GPFSEL | Pins 0-9 (3-bits per pin) |
| 5 | | Pins 50-53 |
| 7 | GPSET | Pins 0-31 (1-bit per pin) |
| 8 | | Pins 32-53 |
| 10 | GPCLR | Pins 0-31 (1-bit per pin) |
| 11 | | Pins 32-53 |
| 13 | GPLEV | Pins 0-31 (1-bit per pin) |
| 14 | | Pins 32-53 |
| ... | | |

The main registers that we need in this case are (see p90ff of [BCM2835 ARM peripherals](#)):

- **GPFSEL**: function select registers (3 bits per pin); set it to 0 for input, 1 for output; 6 more alternate functions available
- **GPSET**: set the corresponding pin
- **GPCLR**: clear the corresponding pin
- **GPLEV**: return the **value** of the corresponding pin

Reading from the button input

| 13: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| 14: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| 15: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |

Read this bit (24)

Sample C code: Button input

First we define some constants that we will need.

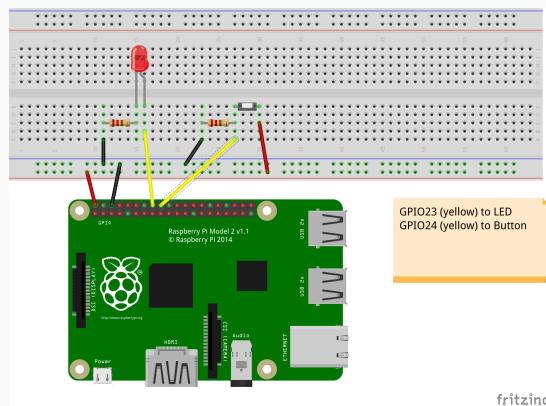

```
// Tunables:  
// PINs (based on BCM numbering)  
#define LED 23  
#define BUTTON 24  
// delay for loop iterations (mainly), in ms  
#define DELAY 200  
  
#define INPUT 0  
#define OUTPUT 1  
  
#define LOW 0  
#define HIGH 1
```

This assumes that we have wired-up the button with GPIO pin 24 and the LED with GPIO pin 23.

The wiring as a Fritzing diagram

To describe a specific wiring, we use **Fritzing diagrams** like this:

An **LED**, as output device, is connected to the RPi2 using **GPIO pin 23**.

A **button**, as input device, is connected to **GPIO pin 24**.

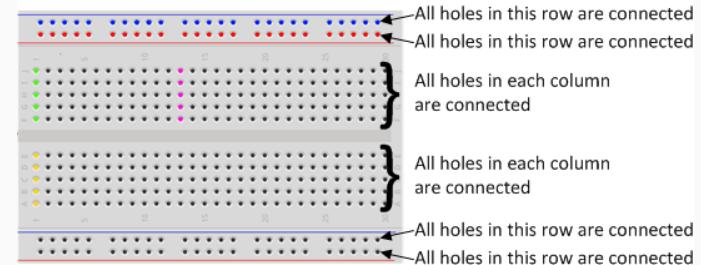

Using a breadboard

To control an external LED, you could directly connect GPIO pins with the LED and a resistor using jumper cables.

However, a breadboard is a more flexible way of wiring peripherals, such as LEDs or buttons, to the RPi.

You need to understand how the columns and the rows on a breadboard are connected, though.

For a good basic intro on how to use a breadboard [follow this link](#)

Sample C code: Button input

We memory-map the addresses for the GPIO registers (as before).

```
gpiobase = 0x3F200000;  
// memory mapping  
if ((fd = open ("/dev/mem", O_RDWR | O_SYNC |  
O_CLOEXEC) ) < 0)  
    return failure (FALSE, "setup:_Unable_to_open_"  
"dev/mem:_%s\n", strerror (errno)) ;  
// GPIO:  
gpio = (uint32_t *)mmap (0, BLOCK_SIZE, PROT_READ |  
PROT_WRITE, MAP_SHARED, fd, gpiobase) ;  
if ((int32_t)gpio == -1)  
    return failure (FALSE, "setup:_mmap_(GPIO)_"  
"failed:_%s\n", strerror (errno)) ;
```

Sample C code: Button input

We set the modes for the LED pin (OUTPUT) and the button pin (INPUT).

```
// setting the mode
fSel = 2; // register 2 (GPFSEL2)
shift = 9; // slot 3 (shift 3*3)
// set the above pin to output mode
*(gpio + fSel) = (*(gpio + fSel) & ~(7 << shift))
| (1 << shift); // Sets bits to one = output

fSel = 2; // register 2 (GPFSEL2)
shift = 12; // slot 4 (shift 4*3)
// set the above pin to input mode
*(gpio + fSel) = (*(gpio + fSel) & ~(7 << shift))
; // Sets bits to zero = input
```

Sample C code: Button input

Inside the main loop, we first read from the bit associated with the button input in the GPLEV0 register.

```
for (j=0; j<1000; j++) {
    if ((*(gpio + 13 /* GPLEV0 */)) & (1 << (BUTTON &
31))) != 0)
       theValue = HIGH ;
    else
       theValue = LOW ;
```

Sample C code: Button input

Further down the loop, we write to the bit associated with the LED output in the GPLCR0 or GPSET0 register.

```
if (theValue == LOW) {
    clrOff = 10; // GPCLR0 for pin 23
    *(gpio + clrOff) = 1 << (LED & 31); // 23-nd bit
        in the register
} else {
    setOff = 7; // GPSET0 for pin 23
    *(gpio + setOff) = 1 << (LED & 31); // 23-nd bit
        in the register
}
// delay ...
```

Sample C code: Button input

Finally, we want to clean-up by setting the LED to LOW. Which kind of code do we need here?

```
// clean-up by setting the LED pin to LOW
```

Summary

- Reading input from a button works in the same way as writing to the LED:
 - ▶ We need to identify the relevant registers and bits for our pin
 - ▶ We declare the pin an INPUT device in the `GPFSEL` register
 - ▶ We read from the associated bit in the `GPLEV` register to get the input
- With the button you have a basic input device to communicate with the system
- In the CW we will combine a button (for input), an LED (for output) and an LCD display (for nicer output) and implement a small app for this configuration.

See sample source: `tut_button.c`
