# Periodic Travelling Waves in Oscillatory Reaction-Diffusion Systems, and Applications to Ecology

Jonathan A. Sherratt

Department of Mathematics Heriot-Watt University

Barcelona, 19-20 April 2007

#### The work on ecological applications is in collaboration with:

#### Xavier Lambin

#### Matthew Smith

- 2 Mathematical Modelling
- Wave Amplitude for Dirichlet Boundary Condition
- Wave Amplitude for Robin Boundary Condition

#### 5 Conclusions

Habitat Boundaries in Ecology Example: Red Grouse on Kerloch Moor Mathematical Representation Periodic Travelling Waves in Red Grouse Second Example: Field Voles in Kielder Forest

- 2 Mathematical Modelling
- 3 Wave Amplitude for Dirichlet Boundary Condition
- Wave Amplitude for Robin Boundary Condition

#### 5 Conclusions

#### Ecological Background

Mathematical Modelling Wave Amplitude for Dirichlet Boundary Condition Wave Amplitude for Robin Boundary Condition Conclusions Habitat Boundaries in Ecology Example: Red Grouse on Kerloch Moor Mathematical Representation Periodic Travelling Waves in Red Grouse Second Example: Field Voles in Kielder Forest

#### Habitat Boundaries in Ecology

- Often ecological habitats are surrounded by unfavourable environments
- Examples: a wood surrounded by open terrain moorland surrounded by farmland marsh surrounded by dry ground

#### Ecological Background

Mathematical Modelling Wave Amplitude for Dirichlet Boundary Condition Wave Amplitude for Robin Boundary Condition Conclusions Habitat Boundaries in Ecology Example: Red Grouse on Kerloch Moor Mathematical Representation Periodic Travelling Waves in Red Grouse Second Example: Field Voles in Kielder Forest

#### Example: Red Grouse on Kerloch Moor

- Red grouse is a cyclic population (period about 4-6 years)
- The study site is moorland, with farmland at its Northern edge
- Farmland is very hostile for red grouse

#### Ecological Background

Mathematical Modelling Wave Amplitude for Dirichlet Boundary Condition Wave Amplitude for Robin Boundary Condition Conclusions Habitat Boundaries in Ecology Example: Red Grouse on Kerloch Moor Mathematical Representation Periodic Travelling Waves in Red Grouse Second Example: Field Voles in Kielder Forest

#### Mathematical Representation

Habitat x > 0:  $\partial w / \partial t = D \partial^2 w / \partial x^2 + f(w)$ Surroundings x < 0:  $\partial w / \partial t = D \partial^2 w / \partial x^2 - \gamma w$ 

where w(x, t) denotes population density.

- For x < 0, finiteness as  $x \to -\infty \Rightarrow w \propto \exp(x\sqrt{\gamma/D})$  at equilibrium
- Equating *w* and  $w_x$  at x = 0 implies the Robin boundary condition  $\sqrt{D}w_x + \sqrt{\gamma}w = 0$
- Note that γ is large, so that the boundary condition will be close to the Dirichlet limit.

Habitat Boundaries in Ecology Example: Red Grouse on Kerloch Moor Mathematical Representation Periodic Travelling Waves in Red Grouse Second Example: Field Voles in Kielder Forest

### Boundary Condition at the Reservoir Edge

- Voles are an important prey species for owls and kestrels
- The open expanse of Kielder Water will greatly facilitate hunting at its edge
- Therefore we expect very high vole loss at the reservoir edge, implying a Robin boundary condition

$$\frac{d}{dx} \left( \begin{array}{c} \text{vole} \\ \text{density} \end{array} \right) = - \left( \begin{array}{c} \text{large} \\ \text{constant} \end{array} \right) \cdot \left( \begin{array}{c} \text{vole} \\ \text{density} \end{array} \right)$$

### Field Vole Wave Generation Question

### Question

Could the boundary condition at the reservoir edge play a role in generating the periodic travelling waves?

Outline

- 2 Mathematical Modelling
- 3 Wave Amplitude for Dirichlet Boundary Condition
- Wave Amplitude for Robin Boundary Condition

### 5 Conclusions

Mathematical Model Typical Model Solutions Amplitude and Phase Equations Typical Solutions Replotted Equilibrium Equations

### Mathematical Model

I consider a generic oscillator model (" $\lambda$ – $\omega$  equations")

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \lambda(r)u - \omega(r)v$$

$$\frac{\partial v}{\partial t} = \frac{\partial^2 v}{\partial x^2} + \omega(r)u + \lambda(r)v$$

$$r = \sqrt{u^2 + v^2}$$

$$\lambda(r) = 1 - r^2$$

$$\omega(r) = \omega_0 + \omega_1 r^2$$

This is the normal form of an oscillatory reaction-diffusion system with scalar diffusion close to a supercritical Hopf bifurcation

- 32

Ecological Background Mathematical Modelling

Wave Amplitude for Dirichlet Boundary Condition Wave Amplitude for Robin Boundary Condition Conclusions Mathematical Model Typical Model Solutions Amplitude and Phase Equations Typical Solutions Replotted Equilibrium Equations

### **Typical Model Solutions**

Eqns: 
$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \lambda(r)u - \omega(r)v$$
  
 $\frac{\partial v}{\partial t} = \frac{\partial^2 v}{\partial x^2} + \omega(r)u + \lambda(r)v$   
 $r = \sqrt{u^2 + v^2}$   
 $\lambda(r) = 1 - r^2$   
 $\omega(r) = \omega_0 + \omega_1 r^2$   
Bcs:  $\epsilon u_x = u$   $\epsilon v_x = v$  at  $x = 0$   
 $u_x = v_x = 0$  at  $x = 50$ 

3

Ecological Background Mathematical Modelling

Wave Amplitude for Dirichlet Boundary Condition Wave Amplitude for Robin Boundary Condition Conclusions Mathematical Model Typical Model Solutions Amplitude and Phase Equations Typical Solutions Replotted Equilibrium Equations

### **Typical Model Solutions**

### **Interim Conclusion**

Robin boundary conditions do generate periodic travelling waves

Mathematical Model Typical Model Solutions Amplitude and Phase Equations Typical Solutions Replotted Equilibrium Equations

### Amplitude and Phase Equations

To study the  $\lambda - \omega$  equations, it is helpful to replace *u* and *v* by  $r = \sqrt{u^2 + v^2}$  and  $\theta = \tan^{-1}(v/u)$ , giving

$$r_t = r_{xx} - r\theta_x^2 + r(1 - r^2)$$
  
$$\theta_t = \theta_{xx} + \frac{2r_x\theta_x}{r} + \omega_0 - \omega_1 r^2$$

Family of periodic travelling wave solutions (0 < R < 1):

$$\left\{ \begin{array}{l} r = R \\ \theta = \left[ \omega(R)t \pm \sqrt{\lambda(R)}x \right] \end{array} \right\} \leftrightarrow \left\{ \begin{array}{l} u = R \cos \left[ \omega(R)t \pm \sqrt{\lambda(R)}x \right] \\ v = R \sin \left[ \omega(R)t \pm \sqrt{\lambda(R)}x \right] \end{array} \right\}$$

Ecological Background Mathematical Modelling

Wave Amplitude for Dirichlet Boundary Condition Wave Amplitude for Robin Boundary Condition Conclusions Mathematical Model Typical Model Solutions Amplitude and Phase Equation: Typical Solutions Replotted Equilibrium Equations

### **Typical Solutions Replotted**

Replotting the solutions in terms of *r* and  $\theta_x$ shows that the long-term solutions for *r* and  $\theta_x$  are independent of time

3

Mathematical Model Typical Model Solutions Amplitude and Phase Equations Typical Solutions Replotted Equilibrium Equations

### **Equilibrium Equations**

### Solns r = R(x), $\theta_x = \Psi(x)$ on $0 < x < \infty$

<ロ> < 四 > < 回 > 三 三 。

Steady Solutions for r and  $\theta_X$ Stability in the Periodic Travelling Wave Family Stability of the Selected Wave Typical Solution in an Unstable Case

2 Mathematical Modelling

### Wave Amplitude for Dirichlet Boundary Condition

Wave Amplitude for Robin Boundary Condition

### 5 Conclusions

Steady Solutions for r and  $\theta_x$ Stability in the Periodic Travelling Wave Family Stability of the Selected Wave Typical Solution in an Unstable Case

### Steady Solutions for *r* and $\theta_x$

For the case  $\epsilon = 0$  (Dirichlet boundary condition), we look for solutions of

$$R_{xx} + R(1 - R^2 - \Psi^2) = 0$$
  
$$\Psi_x + 2\Psi R_x / R + (\omega_0 - K) - \omega_1 R^2 = 0$$

subject to R = 0 at x = 0 and  $R, \Psi \rightarrow \text{constants as } x \rightarrow \infty$ .

Jonathan A. Sherratt Periodic Travelling Waves in Oscillatory Reaction-Diffusion System

Steady Solutions for r and  $\theta_x$ Stability in the Periodic Travelling Wave Family Stability of the Selected Wave Typical Solution in an Unstable Case

### Steady Solutions for *r* and $\theta_x$

For the case  $\epsilon = 0$  (Dirichlet boundary condition), we look for solutions of

$$R_{xx} + R(1 - R^2 - \Psi^2) = 0$$
  
$$\Psi_x + 2\Psi R_x / R + (\omega_0 - K) - \omega_1 R^2 = 0$$

subject to R = 0 at x = 0 and  $R, \Psi \rightarrow \text{constants as } x \rightarrow \infty$ .

Hypothesis 1: There is a solution that is monotonic in R for exactly one value of K

Hypothesis 2: Any non-monotonic solutions are unstable as solutions of the original partial differential equations

A D > A P >

- 32

Steady Solutions for r and  $\theta_x$ Stability in the Periodic Travelling Wave Family Stability of the Selected Wave Typical Solution in an Unstable Case

### Steady Solutions for *r* and $\theta_x$

For the case  $\epsilon = 0$  (Dirichlet boundary condition), we look for solutions of

$$R_{xx} + R(1 - R^2 - \Psi^2) = 0$$
  
$$\Psi_x + 2\Psi R_x / R + (\omega_0 - K) - \omega_1 R^2 = 0$$

subject to R = 0 at x = 0 and  $R, \Psi \rightarrow \text{constants as } x \rightarrow \infty$ .

Exact solution: In fact there is an exact (monotonic) solution for  $K = \omega_0 + (9 - \sqrt{81 + 72\omega_1^2})/(4\omega_1)$ :

$$R(x) = r_{ptw} \tanh\left(x/\sqrt{2}\right)$$
  $\Psi(x) = \psi_{ptw} \tanh\left(x/\sqrt{2}\right)$ 

where 
$$r_{ptw} = \left\{ \frac{1}{2} \left[ 1 + \sqrt{1 + \frac{8}{9}\omega_1^2} \right] \right\}^{-1/2} \qquad \psi_{ptw} = -\operatorname{sign}(\omega_1) \left\{ \frac{\sqrt{1 + \frac{8}{9}\omega_1^2 - 1}}{\sqrt{1 + \frac{8}{9}\omega_1^2 + 1}} \right\}^{1/2}$$

Steady Solutions for r and  $\theta_x$ Stability in the Periodic Travelling Wave Family Stability of the Selected Wave Typical Solution in an Unstable Case

### Steady Solutions for *r* and $\theta_x$

For the case  $\epsilon = 0$  (Dirichlet boundary condition), we look for solutions of

$$R_{xx} + R(1 - R^2 - \Psi^2) = 0$$
  
$$\Psi_x + 2\Psi R_x / R + (\omega_0 - K) - \omega_1 R^2 = 0$$

subject to R = 0 at x = 0 and  $R, \Psi \rightarrow \text{constants as } x \rightarrow \infty$ .

Exact solution: the wave amplitude

$$r_{ptw} = \left\{ \frac{1}{2} \left[ 1 + \sqrt{1 + \frac{8}{9}\omega_1^2} \right] \right\}^{-1/2}$$

is in very good agreement with that found in numerical simulations

Steady Solutions for r and  $\theta_x$ . Stability in the Periodic Travelling Wave Family Stability of the Selected Wave Typical Solution in an Unstable Case

### Stability in the Periodic Travelling Wave Family

Some members of the periodic travelling wave family are stable as solutions of the partial differential equations, while others are unstable

3

#### 5 Conclusions

Review of Boundary Condition Perturbation theory calculation

# **Review of Boundary Condition**

The zero Dirichlet boundary condition considered previously is an approximation to a Robin condition. For the  $\lambda-\omega$  equations, it is possible to quantify the quality of this approximation.

$$u_t = u_{xx} + \lambda(r)u - \omega(r)v$$

$$v_t = v_{xx} + \omega(r)u + \lambda(r)v$$

$$r = \sqrt{u^2 + v^2}$$

$$\lambda(r) = 1 - r^2$$

$$\omega(r) = \omega_0 + \omega_1 r^2.$$

Boundary conditions at x = 0:

Dirichlet: u = v = 0Robin:  $u_x = (1/\epsilon)u$ ,  $v_x = (1/\epsilon)v$

Review of Boundary Condition Perturbation theory calculation

## Perturbation theory calculation

- Conclusion: the solution for *R*(*x*) changes at *O*(*ϵ*), but the periodic wave amplitude *R*(∞) changes only at *O*(*ϵ*<sup>3</sup>).
- So: the Dirichlet boundary condition is a very good approximation to the Robin condition.

Review of Boundary Condition Perturbation theory calculation

## Perturbation theory calculation

- Conclusion: the solution for R(x) changes at O(ε), but the periodic wave amplitude R(∞) changes only at O(ε<sup>3</sup>).
- So: the Dirichlet boundary condition is a very good approximation to the Robin condition.
- This result is for the  $\lambda \omega$ equations. Future work: is this true for other oscillatory reaction-diffusion systems?

- Wave Amplitude for Robin Boundary Condition

#### 5 Conclusions

Conclusions Back to the Example of Field Voles in

# Conclusions

- A Robin boundary condition does generate periodic travelling waves
- The periodic wave given by the Robin boundary condition is very well approximated by that given by the Dirichlet boundary condition
- This is important because a Dirichlet boundary condition is much simpler both analytically and numerically
- Most ecological models use Dirichlet rather than Robin conditions, without any justification. My results provide justification in the context of periodic travelling wave generation
