Equations in Free Groups

Definition (Free group)

Free group generated by $\boldsymbol{\Gamma}$

- words over $\Gamma \cup \Gamma^{-1}$
- no cancellation except trivial one $(aa^{-1} = 1)$

Wlog $\Gamma = \Gamma^{-1}$.

・ 何 ト ・ ヨ ト ・ ヨ ト

Progress in semigroups

Schulz 1990

Regular constraints for free semigroup.

Progress in semigroups

Schulz 1990

Regular constraints for free semigroup.

- description of regular languages R_1, R_2, \ldots as part of the input
- conditions $X \in R_i$ or $X \notin R_i$

Description: by a monoid M:

- homomorphism ρ from Γ to M
- $\rho(S(X))$ is fixed for each X

A B A A B A

Involution and free groups

Diekert, Gutiérrez, Hagenah 2001 Solving equations in free groups (with regular constraints) reduces to Solving equations in free semigroups with regular constraints and involution

Involution and free groups

Diekert, Gutiérrez, Hagenah 2001

Solving equations in free groups (with regular constraints) reduces to Solving equations in free semigroups with regular constraints and involution

- purely syntactical
- bijection on the solutions (in case of free groups: reduced)

In groups

- triangulate the equation
- remove cancellation: $XY = Z \rightarrow X = X'R$, $Y = R^{-1}Y'$, X'Y' = Z
- look only at reduced solutions

A B A A B A

In groups

- triangulate the equation
- remove cancellation: $XY = Z \rightarrow X = X'R$, $Y = R^{-1}Y'$, X'Y' = Z
- look only at reduced solutions

Definition (Involution)

Think of it as the inverse in a free group. Bijection $\overline{\cdot}$ on Γ^* and on \mathcal{X} such that

•
$$\overline{\overline{a}} = a$$

•
$$\overline{a_1 a_2 \cdots a_k} = \overline{a_k} \cdots \overline{a_2} \overline{a_1}$$

▲ 国 ▶ | ▲ 国 ▶

Generation of all solutions?

Adding involution and regular constraints to Plandowski's construction:

- works for satisfiability [Diekert, Gutiérrez, Hagenah 2001]
- does not work for generation of all solutions (problems with involution)

Generation of all solutions?

Adding involution and regular constraints to Plandowski's construction:

- works for satisfiability [Diekert, Gutiérrez, Hagenah 2001]
- does not work for generation of all solutions (problems with involution)

We do this for Jeż's solution.

Representation of all solutions

- Graph (exponential size)
- Nodes: equations of size length O(n), at most n occurrences of variables
- Edges between nodes, labelled with (families of) morphisms

4 3 > 4 3

Representation of all solutions

- Graph (exponential size)
- Nodes: equations of size length O(n), at most n occurrences of variables
- Edges between nodes, labelled with (families of) morphisms

Preserving solutions

- If S is a solution of U = V then
 - the equation is trivial or
 - there is $\phi\text{-labelled}$ edge to an equation U'=V' with a solution S' such that $S=\phi(S')$

Most difficult

Consider $a = \overline{a}$, $b = \overline{b}$. *ab*-blocks: $(ab)^i$, $b(ab)^i$, $(ab)^i a$, $(ba)^i$

ab is crossing

- There is *ab*-factor partially in X and partially outside.
- What is the part inside?

```
Definition

ab-prefix of S(X) a, b or ab-block

ab-suffix of S(X) a, b or ab-block
```

• • = • • = •

f is the *ab*-prefix of S(X)

• replace X with fX and \overline{X} by $\overline{X} \overline{f}$ (implicitly change solution S(X) = fw to S(X) = w $S(\overline{X}) = \overline{w}\overline{f}$ to $S(\overline{X}) = \overline{w}$)

f is the *ab*-prefix of S(X)

• replace X with fX and \overline{X} by $\overline{X} \overline{f}$ (implicitly change solution S(X) = fw to S(X) = w $S(\overline{X}) = \overline{w}\overline{f}$ to $S(\overline{X}) = \overline{w}$)

• change ρ_X , $\rho_{\overline{X}}$ so that : $\rho_X = \rho(f)\rho'_X$, $\rho_{\overline{X}} = \rho_{\overline{X'}}\rho(\overline{f})$

f is the ab-prefix of S(X)

• replace X with
$$fX$$
 and \overline{X} by $\overline{X}\overline{f}$
(implicitly change solution $S(X) = fw$ to $S(X) = w$
 $S(\overline{X}) = \overline{w}\overline{f}$ to $S(\overline{X}) = \overline{w}$)

• change ρ_X , $\rho_{\overline{X}}$ so that : $\rho_X = \rho(f)\rho'_X$, $\rho_{\overline{X}} = \rho_{\overline{X'}}\rho(\overline{f})$

• if
$$S(X) = 1$$
 and $\rho_X = \rho(1)$ then remove X.

f is the ab-prefix of S(X)

• replace X with fX and \overline{X} by $\overline{X} \overline{f}$ (implicitly change solution S(X) = fw to S(X) = w $S(\overline{X}) = \overline{w}\overline{f}$ to $S(\overline{X}) = \overline{w}$)

• change ρ_X , $\rho_{\overline{X}}$ so that : $\rho_X = \rho(f)\rho'_X$, $\rho_{\overline{X}} = \rho_{\overline{X'}}\rho(\overline{f})$

• if
$$S(X) = 1$$
 and $\rho_X = \rho(1)$ then remove X.

Lemma

Uncrossing preserves solutions

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

(B)

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

• if there is non-crossing *ab*: do it!

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

- if there is non-crossing *ab*: do it!
- each crossing *ab*-compression: +2n letters

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

- if there is non-crossing *ab*: do it!
- each crossing *ab*-compression: +2n letters
- if size of the equation $\leq 18n^2 2n$: do it!

< □ > < □ > < □ > < □ > < □ > < □ >

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

- if there is non-crossing *ab*: do it!
- each crossing *ab*-compression: +2*n* letters
- if size of the equation $\leq 18n^2 2n$: do it!
- there are $\leq 4n$ crossing *ab*

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

- if there is non-crossing *ab*: do it!
- each crossing *ab*-compression: +2*n* letters
- if size of the equation $\leq 18n^2 2n$: do it!
- there are $\leq 4n$ crossing *ab*
- so some covers $\geq (18n^2 2n)/4n \geq 4n$ letters

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

- if there is non-crossing *ab*: do it!
- each crossing *ab*-compression: +2*n* letters
- if size of the equation $\leq 18n^2 2n$: do it!
- there are $\leq 4n$ crossing *ab*
- so some covers $\geq (18n^2 2n)/4n \geq 4n$ letters
- so 4n/2 = 2n letters are removed
Crucial property

Theorem (Main property: keeps the equation short)

For any solution there is always ab such that after ab-compression the equation has size $O(n^2)$.

Proof.

Take c = 18

- if there is non-crossing *ab*: do it!
- each crossing *ab*-compression: +2*n* letters
- if size of the equation $\leq 18n^2 2n$: do it!
- there are $\leq 4n$ crossing *ab*
- so some covers $\geq (18n^2 2n)/4n \geq 4n$ letters
- so 4n/2 = 2n letters are removed
- the equation does not grow
