

## Lecture 7

There are  $n$  positions  
and you have to choose  
 $i$  to fill with  
 $x$ s

There is an important consequence of our  
proof that  $|P(x)| = 2^{|x|}$ .

The number of strings over  $\{x, y\}$  of  
length  $n$  with exactly  $i$   $x$ s is  $\binom{n}{i}$

Example All strings of  $x$ s and  $y$ s  
of length 4 with 2  $x$ s are

$\{xxyy, xyxy, xyyx, yxxy, yyxx, yxyx\}$

$$\binom{4}{2} = \frac{4!}{2!2!} = \underline{\underline{6}}$$

✓ We use this result to prove the  
binomial theorem.

A nice application of Counting is the binomial theorem.

Binomial theorem

$$(x+y)^n = \sum_{i=0}^n \binom{n}{i} x^i y^{n-i}$$

Where do those numbers come from  
and commutativity of addition.

We distributivity ~~and~~ but don't apply  
commutativity of multiplication.

Example  $\swarrow$

$$(x+y)^3 = xxx + (xxy + xyx + yxx) + (xyy + yxy + yyx) + yyy$$

• all strips  $xxy + xyx + yxx$  equal  $x^2y$   
when commutativity of multiplication is used. Why 3

$$\begin{aligned} \text{terms} &= \# \text{ strips of } x \text{ and } y\text{'s with two } x\text{'s.} \\ &= \binom{3}{2} \end{aligned}$$

• Similar argument ~~is~~ for  $xyy + yxy + yyx$ .

Example We expand  $(2a-b)^{20}$  and calculate the coefficient of  $a^3$ .

$(2a-b = 2a + (-b))$   
 Thus  $(2a + (-b))^{20} = \sum_{i=0}^{20} \binom{20}{i} (2a)^i (-b)^{20-i}$   
 $= \sum_{i=0}^{20} \binom{20}{i} 2^i (-1)^{20-i} a^i b^{20-i}$

The coefficient of  $a^3$  is  $\binom{20}{3} 2^3 (-1)^{17}$   
 $= - \binom{20}{3} 2^3 = - \frac{20!}{3! 17!} 8 = - \frac{20 \cdot 19 \cdot 18 \cdot \cancel{17} \cdot \cancel{16} \cdot \cancel{15} \cdot \cancel{14} \cdot \cancel{13} \cdot \cancel{12} \cdot \cancel{11} \cdot \cancel{10} \cdot \cancel{9} \cdot \cancel{8} \cdot \cancel{7} \cdot \cancel{6} \cdot \cancel{5} \cdot \cancel{4} \cdot \cancel{3} \cdot \cancel{2} \cdot \cancel{1}}{\cancel{17} \cdot \cancel{16} \cdot \cancel{15} \cdot \cancel{14} \cdot \cancel{13} \cdot \cancel{12} \cdot \cancel{11} \cdot \cancel{10} \cdot \cancel{9} \cdot \cancel{8} \cdot \cancel{7} \cdot \cancel{6} \cdot \cancel{5} \cdot \cancel{4} \cdot \cancel{3} \cdot \cancel{2} \cdot \cancel{1}} = -9120$

## K-permutations

Given a set with  $n$  elements. A  $k$ -tuple of such elements without repeats is called a  $k$ -permutation

Example Let  $X = \{a, b, c\}$ . The set of 2-permutations of  $X$  is  $\{ab, ac, ba, bc, ca, cb\}$ .

The number of  $k$ -permutations of an  $n$ -element set is

$${}^n P_k = \frac{n!}{(n-k)!}$$

If  $k=n$ , we simply talk of a permutation of  $n$  objects.

Example Permutations of the set  $\{a, b, c\}$  is  $\{abc, acb, bac, bca, cab, cba\}$

## Summary of counting

|                | order                             | no order                          |
|----------------|-----------------------------------|-----------------------------------|
| repetitions    | <u>K-tuples</u><br>$k^n$          | not discussed                     |
| no repetitions | <u>permutations</u><br>${}^n P_k$ | <u>Combinations</u><br>${}^n C_k$ |

$${}^n P_k = k! {}^n C_k$$

## Boolean operations on sets

We shall use Venn diagrams.

$$A \cap B = \{x : x \in A \text{ and } x \in B\}$$

$A \cap B =$  Intersection of A and B

$$A \cup B = \{x : x \in A \text{ or } x \in B\}$$

$A \cup B =$  union of A and B

$$A \setminus B = \{x : x \in A, x \notin B\}$$

Set difference

### Example

$$A = \{1, 2, 3, 4, 5\}, B = \{1, 2, 5, 6\}$$

$$A \cap B = \{1, 2, 5\}$$

$$A \cup B = \{1, 2, 3, 4, 5, 6\}$$

$$A \setminus B = \{3, 4\}$$

$$B \setminus A = \{6\}$$

Sets A and B are called disjoint if

$$A \cap B = \emptyset$$

If A and B are disjoint  
then  
 $|A \cup B| = |A| + |B|$
