

Lecture 17

1.11 Truth trees

- (1) Truth tables are laborious to construct.
- (2) Truth tables don't generalize to FOL.

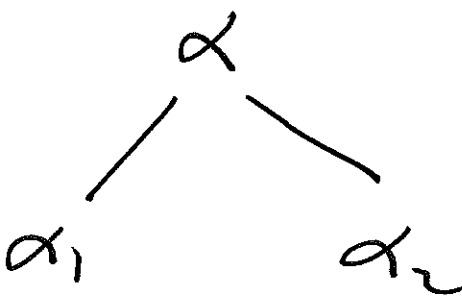

Truth trees are usually more efficient than truth tables and do generalize to FOL.

Truth trees \neq parse trees

- We use a data structure, a tree, to represent the truth value options of a formula.
- What is not true is false - we only represent what is true.
- The truth tree algorithm is a divide and conquer algorithm.

- The truth tree algorithm is about satisfiability.

There are two kinds of rules: α -rules
and β -rules

α -rule	β -rule
α - α_1 α_2	 <pre> graph TD alpha[alpha] --- alpha1[alpha_1] alpha --- alpha2[alpha_2] </pre>

α -rule: α is T precisely when both α_1 and α_2 are T.

β -rule: α is T precisely when at least one of α_1 and α_2 is T.

Examples

Both of these trees contain exactly the same information as truth trees

We shall exclude \oplus from what follows
 since $\bar{X} \oplus Y \equiv \neg(X \leftrightarrow Y)$

Possible shapes of wff

$$\begin{array}{cccc}
 X \wedge Y & \neg(X \vee Y) & \neg(X \rightarrow Y) & \neg\neg X \\
 \textcircled{1} & \textcircled{2} & \textcircled{3} & \textcircled{4}
 \end{array}$$

$$\begin{array}{ccc}
 \neg(X \wedge Y) & X \vee Y & X \rightarrow Y \\
 \textcircled{5} & \textcircled{6} & \textcircled{7}
 \end{array}$$

$$\begin{array}{cc}
 X \leftrightarrow Y & \neg(X \leftrightarrow Y) \\
 \textcircled{8} & \textcircled{9}
 \end{array}$$

We now represent the truth tables for these wffs in terms of α -rules or β -rules.

$$\textcircled{1} \quad X \wedge Y : \begin{array}{c} X \wedge Y \\ | \\ X \\ Y \end{array}$$

$$\textcircled{2} \quad \neg(X \vee Y) \quad \neg(X \vee Y)$$

$$(\equiv \neg X \wedge \neg Y) \quad \begin{array}{c} | \\ \neg X \\ \neg Y \end{array}$$

$$\textcircled{3} \quad \neg(X \rightarrow Y) \quad \neg(X \rightarrow Y)$$

$$\equiv \neg(\neg X \vee Y) \quad \begin{array}{c} | \\ X \\ \neg Y \end{array}$$

$$\equiv \neg\neg X \wedge \neg Y$$

$$\equiv X \wedge \neg Y$$

$$\textcircled{4} \quad \neg\neg X \quad \text{double negation}$$

$$\quad \quad \quad |$$

$$\quad \quad \quad X$$

since $\neg(X \wedge Y) \equiv \neg X \vee \neg Y$

since $X \rightarrow Y \equiv \neg X \vee Y$

$$\begin{aligned} X \leftrightarrow Y &\equiv (X \rightarrow Y) \wedge (Y \rightarrow X) \\ &\equiv (\neg X \vee Y) \wedge (Y \vee \neg X) \\ &\equiv ((\neg X \vee Y) \wedge Y) \vee \\ &\quad (\neg X \vee Y) \wedge X \\ &\equiv (\neg X \wedge Y) \vee (Y \wedge Y) \vee \\ &\quad (\neg X \wedge X) \vee (Y \wedge X) \\ &\quad \quad \quad \equiv \text{F} \\ &\equiv (\neg X \wedge Y) \vee (X \wedge Y) \end{aligned}$$

For each of our 9 shapes we have drawn a tree

Example

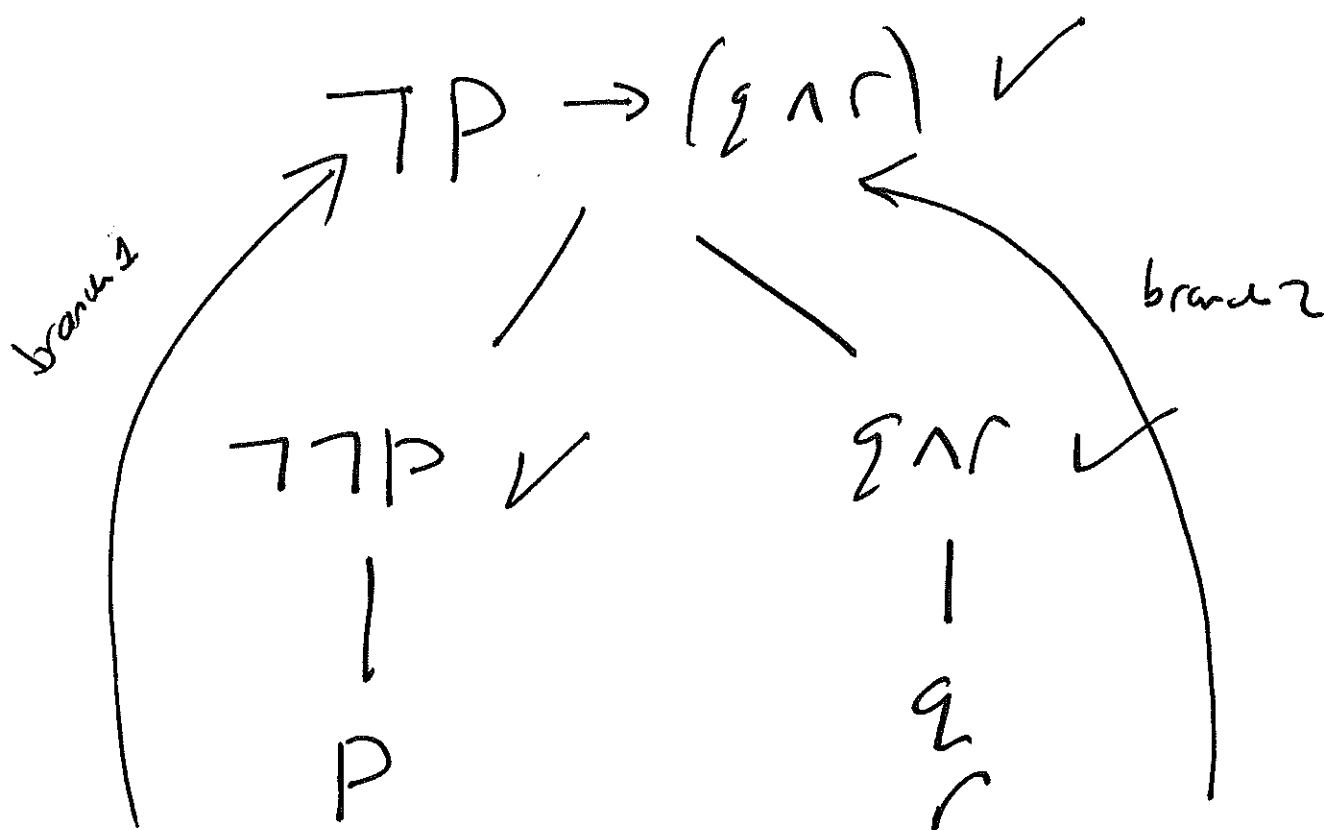

X	Y	$X \leftrightarrow Y$
T	T	T ←
T	F	F (default)
F	T	F (default)
F	F	T ←

Example Construct a truth tree

for $\neg P \rightarrow (Q \wedge R)$

(NB Not a predicate!)

$\neg P \rightarrow (Q \wedge R)$ is true when

P is true or $Q \wedge R$ is true

$\therefore \neg P \rightarrow (Q \wedge R) \equiv P \vee (Q \wedge R)$

We can use this truth tree to write down the truth table of $\neg P \rightarrow (Q \wedge R)$
 (though we would not normally do this)

P	Q	R	$\neg P \rightarrow (Q \wedge R)$
T	T	T	T
T	T	F	T
T	F	T	T
T	F	F	T
F	T	T	T
F	T	F	F
F	F	T	F
F	F	F	F

Annotations in the table:

- A bracket on the right side of the first four rows (where P is true) is labeled "since P true".
- The row where P is false, Q is true, and R is true has Q and R circled, with the label "Q & R true" next to it.
- A bracket on the right side of the last three rows (where P is false) is labeled "default".
