Attempt all questions.

A University approved calculator may be used for basic computations, but appropriate working must be shown to obtain full credit.

Mathematical Formulae are supplied.
Question 1 (15 Marks)
Find the general solution of the following differential equations:

(a) \[ \frac{d^2 y}{dt^2} - 3 \frac{dy}{dt} - 4y = 0; \]

(b) \[ \frac{d^2 y}{dt^2} + 2 \frac{dy}{dt} + 5y = 3e^{2t}. \]

Question 2 (15 Marks)
Consider the flow of an electrical current \( I(t) \) in a simple series circuit, as shown in Figure 1. The resistor has resistance \( R = 8 \) Ohms, the capacitor has capacitance \( C = 1/16 \) Farads and the inductor has inductance \( L = 1 \) Henrys. A battery or power source provides an impressed voltage of \( V(t) = \sin(2t) \) volts at any given time. The rate of change of total charge, \( Q(t) \) Coulombs, in the capacitor at time \( t \), is thus governed by the linear, non-homogeneous second order differential equation,

\[
\frac{d^2 Q}{dt^2} + 8 \frac{dQ}{dt} + 16Q = \sin(2t). \tag{1}
\]

If initially, \( Q(0) = 1 \) and \( Q'(0) = 0 \), find the solution to the differential equation (1) which satisfies these initial conditions, and describe how the solution, \( Q(t) \), evolves in time.

\[ \text{Figure 1: Simple LCR electrical circuit.} \]

Question 3 (10 Marks)
Find the general solution of the differential equation

\[
\frac{d^2 y}{dt^2} - 6 \frac{dy}{dt} + 9y = e^{3t}.
\]
Question 4 (10 Marks)
(a) Find the Laplace transform of the function
\[ f(t) = e^{3t} \cos(5t), \]
stating any formula from the Laplace transform table you have used.

(b) Find the inverse Laplace transform of the function
\[ \mathcal{F}(s) = \frac{1}{s^2 + 2s + 2}. \]

Question 5 (15 Marks)
Consider the damped spring system shown in figure 2, which consists of a mass which slides on the horizontal surface, and is attached to a spring, which is fixed to a vertical wall at the other end. Suppose that the mass, initially at rest in the equilibrium position, is acted upon by an external forcing function \( f(t) \), so that the initial value problem for the motion of the mass is
\[ y'' + 4y' + 5y = f(t), \quad \text{with} \quad y(0) = 0, \quad y'(0) = 0. \]  \hspace{1cm} (2)

Use the Laplace transform to determine the solution to this initial value problem in the case when the external force is:

(a) \( f(t) = 1 \) for all \( t \geq 0 \), i.e. a constant unit force;
(b) \( f(t) = \delta(t) \) for all \( t \geq 0 \), i.e. the mass is given a sharp hammer blow at time \( t = 0 \).

In both cases (a) and (b) sketch the behaviour of the solution for all \( t \geq 0 \).

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{mass-spring-system.png}
\caption{Simple damped, mass-spring system.}
\end{figure}
Question 6 (10 Marks)
Consider the electrical circuit in figure 3. Kirchoff's loop rule, Ohm's law and Kirchoff's node rule applied to the left closed loop, the right closed loop, and at the nodes P and Q, respectively, tell us that the unknown currents, \( I_1, I_2 \) and \( I_3 \), in the electrical circuit in figure 3, satisfy the system of equations

\[
\begin{align*}
20I_1 + 10I_2 &= 80, \\
10I_2 + 25I_3 &= 90, \\
I_1 - I_2 + I_3 &= 0, \\
-I_1 + I_2 - I_3 &= 0.
\end{align*}
\]

Use Gaussian elimination to solve the system of equations and determine \( I_1, I_2 \) and \( I_3 \).

![Electrical Circuit Diagram](image)

Figure 3: Complex electrical circuit in equilibrium.

Question 7 (10 Marks)
Find the eigenvalues of the matrix

\[
A = \begin{pmatrix}
2 & -1 & 0 \\
-1 & 2 & -1 \\
0 & -1 & 2
\end{pmatrix}.
\]

In addition, find the eigenvector corresponding to the eigenvalue \( \lambda = 2 \).
Question 8 (15 Marks)
Two identical simple pendula oscillate in the plane as shown in Figure 4. Both pendula consist of light rods of length $\ell = 10$ and are suspended from the same ceiling a distance $L = 15$ apart, with equal masses $m = 1$ attached to their ends. The angles the pendula make to the downward vertical are $\theta_1$ and $\theta_2$, and they are coupled through the spring shown which has stiffness coefficient $k = 1$. The spring has unstretched length $L = 15$. You may also assume that the acceleration due to gravity $g = 10$.

(a) Assuming that the oscillations of the spring remain small in amplitude, so that $|\theta_1| \ll 1$ and $|\theta_2| \ll 1$, by applying Newton's second law and and Hooke's law, show that the coupled pendula system gives rise to the system of differential equations

$$\frac{d^2 \Theta}{dt^2} = A \Theta, \quad \text{where} \quad A = \begin{pmatrix} -2 & 1 \\ 1 & -2 \end{pmatrix},$$

and

$$\Theta = \begin{pmatrix} \theta_1 \\ \theta_2 \end{pmatrix}$$

is the vector of unknown angles for each of the pendula shown in Figure 4.

(b) By looking for a solution of the form $\Theta(t) = Ce^{i\omega t}$ for a constant vector $C$, show that solving the system of differential equations (4) reduces to solving the eigenvalue problem

$$(A + \omega^2 I)C = 0.$$  \hspace{1cm} (5)

(c) Solve the eigenvalue problem (5) in part (b) above, stating clearly the eigenvalues and associated eigenvectors.

(d) Hence enumerate the possible modes of oscillation of the masses corresponding to each eigenvalue-eigenvector pair.

(e) Finally, write down the general solution of the system of equations (4).

---

**Figure 4: Simple coupled pendula system.**
(a) Auxiliary Equation: \( x^2 - 3x - 4 = 0 \)
\[ \begin{align*}
\iff & \quad \lambda = 4 \text{ or } \lambda = -1 \\
\implies & \quad y(t) = c_1 e^{4t} + c_2 e^{-t}
\end{align*} \]

(b) \( AE: x^2 + 2x + 5 = 0 \implies \lambda = -1 \pm 2i \)
\[ \begin{align*}
\implies & \quad y_{CF}(t) = e^{-t} (c_1 \sin 2t + c_2 \cos 2t)
\end{align*} \]

Try particular integral of form

\[ y_{PI}(t) = Ae^{2t} \]

Substituting \( y_{PI} \) into differential equation \( \implies A = \frac{3}{13} \).

\[ \implies \text{general solution is} \]
\[ y(t) = e^{-t} (c_1 \sin 2t + c_2 \cos 2t) + \frac{3}{13} e^{2t}. \]
1st: AE : $\lambda^2 + 8\lambda + 16 = 0 \Rightarrow \lambda = -4$ (twice)

$\Rightarrow Q_{CF}(t) = (C_1 + C_2 t) e^{-4t}$

2nd: Try particular integral of form

$Q_{PI} = A\sin 2t + B\cos 2t$.

Substituting this into full non-homogeneous differential equation $\Rightarrow$

$-4(Asin 2t + B\cos 2t) + 8(2A\cos 2t - 2B\sin 2t) + 16(Asin 2t + B\cos 2t) = 5\sin 2t$

Equating coefficients of $\sin 2t$ & $\cos 2t$ $\Rightarrow$

$12A - 16B = 1 \iff \begin{align*}
16A + 12B = 0
\end{align*}$

Hence general soln is

$Q(t) = (C_1 + C_2 t) e^{-4t} + \frac{3}{100} \sin 2t - \frac{1}{25} \cos 2t$

3rd: Using initial data

$Q(0) = 1 \Rightarrow C_1 = \frac{26}{25}$

$Q'(0) = 0 \Rightarrow 0 = C_2 - 4C_1 = \frac{41}{10}$

Finally $\Rightarrow$ soln to IVP is $Q(t) = \left(\frac{26}{25} + \frac{41}{10} t\right) e^{-4t} + \frac{3}{100} \sin 2t - \frac{1}{25} \cos 2t$
Looking at the final solution we see that it is a linear combination of an exponentially decaying part (the first term), which will die out very fast, and a pure oscillatory part (the last two terms) which will eventually represent the long-time solution & equilibrium state (driven by the alternating voltage source).
1st: \[ \gamma_F(t) = (C_1 + C_2 t) e^{3t} \]

2nd: Try a particular integral of form

\[ \gamma_{pi}(t) = A t^2 e^{3t} \]

Substituting this into differential equation

\[
2A + 6At + 6At^2 + 9At^3 e^{3t} \\
-6\left(2At + 3At^2\right)e^{3t} \\
+ 9At^2 e^{3t}
\]

\[ = e^{3t} \quad \Rightarrow A = \frac{1}{2} \]

\[ \Rightarrow \text{general soln is} \quad \gamma(t) = (C_1 + C_2 t + \frac{1}{2} t^2) e^{3t}. \]
(a) \( f(t) = e^{3t} \cos 5t \)

Factor of \( e^{3t} \) \( \Rightarrow \) we can use the shift theorem, so first use table of Laplace transforms to find LT of \( \cos 5t \):

\[
\mathcal{L}\{\cos 5t\} = \frac{s}{s^2 + 25}
\]

now using the shift thm., \( \mathcal{L}\{e^{3t}f(t)\} = F(s-3) \)

\[
\Rightarrow \quad \mathcal{L}\{e^{3t}\cos 5t\} = \frac{s-3}{(s-3)^2 + 25}
\]

(b) \( f(s) = \frac{1}{s^2 + 25 + 2} \).

Since for the quadratic form in the denominator \( b^2 - 4ac < 0 \) \( \Rightarrow \) rather than factorize into complex roots, complete the square instead:

\[
s^2 + 25 + 2 = (s+1)^2 + 1
\]

\[
\Rightarrow \quad f(s) = \frac{1}{(s+1)^2 + 1}
\]

From table of LTs, since \( \mathcal{L}\{\sin t\} = \frac{1}{s^2 + 1} \), then via the shift thm.,

\[
\mathcal{L}\{e^{-t}\sin t\} = \frac{1}{(s+1)^2 + 1} \quad \Rightarrow \quad \mathcal{L}\{f(s)f(s)\} = e^{-t}\sin t.
\]
\[ y'' + 4y' + 5y = f(t), \quad y(0) = y'(0) = 0. \]

Take Laplace Transform of differential equation \& using initial conditions \Rightarrow

\[ s^2Y(s) - sy(0) - y'(0) + 4(sY(s) - y(0)) + 5Y(s) = \tilde{f}(s) \]

\[ \Leftrightarrow \quad (s^2 + 4s + 5) \tilde{y}(s) = \tilde{f}(s) \]

\[ \Leftrightarrow \quad \tilde{y}(s) = \frac{\tilde{f}(s)}{s^2 + 4s + 5} \]

(a) \( f(t) = 1 \Rightarrow \tilde{f}(s) = \frac{1}{s} \).

Hence \( \tilde{y}(s) = \frac{1}{s} \cdot \frac{1}{s^2 + 4s + 5} \).

\[ \frac{1}{s} \cdot \frac{1}{s^2 + 4s + 5} = \frac{A}{s} + \frac{Bs + C}{s^2 + 4s + 5} \quad \text{(using partial fractions)} \]

\[ \Leftrightarrow \quad 1 = A(s^2 + 4s + 5) + (Bs + C)s \]

Equating like powers of \( s \):

\[ s^0: \quad 1 = 5A \quad \Leftrightarrow \quad A = \frac{1}{5} \]

\[ s^1: \quad 0 = 4A + C \quad \Leftrightarrow \quad C = -\frac{4}{5} \]

\[ s^2: \quad 0 = A + B \quad \Leftrightarrow \quad B = -\frac{1}{5} \]

\[ \Rightarrow \quad \tilde{y}(s) = \frac{1}{5} \cdot \frac{1}{s} - \frac{1}{5} \cdot \frac{s + 4}{s^2 + 4s + 5} \]
\( \mathcal{L}\{f(t)\} = \frac{1}{(s^2 + 4s + 5)} = \frac{1}{(s+2)^2 + 1} \)

Using table of Laplace Transforms
\[ \mathcal{L}\{e^{-2t} \sin t\} = \frac{1}{(s+2)^2 + 1} \]

\[ \Rightarrow \mathcal{L}\{f(t)\} = \begin{cases} \frac{1}{\sqrt{5}} e^{-2t} \sin t, & t > 0, \\ 0, & t < 0. \end{cases} \]
Augmented matrix

\[ H = \begin{pmatrix} 20 & 10 & 0 & 80 \\ 0 & 10 & 25 & 90 \\ 1 & -1 & 1 & 0 \\ -1 & 1 & -1 & 0 \end{pmatrix} \]

\[ R_3 \rightarrow 20 R_3 - R_1 \quad \Rightarrow \quad H = \begin{pmatrix} 20 & 10 & 0 & 80 \\ 0 & 10 & 25 & 90 \\ 0 & -30 & 20 & -80 \\ 0 & 30 & -20 & 80 \end{pmatrix} \]

\[ R_4 \rightarrow 20 R_4 + R_1 \]

\[ R_3 \rightarrow R_3 + 3R_2 \quad \Rightarrow \quad H = \begin{pmatrix} 20 & 10 & 0 & 80 \\ 0 & 10 & 25 & 90 \\ 0 & 0 & 95 & 190 \\ 0 & 0 & -95 & -190 \end{pmatrix} \]

\[ R_4 \rightarrow R_4 + R_3 \quad \Rightarrow \quad H = \begin{pmatrix} 20 & 10 & 0 & 80 \\ 0 & 10 & 25 & 90 \\ 0 & 0 & 95 & 190 \\ 0 & 0 & 0 & 0 \end{pmatrix} \]

(i.e. last equation redundant).

Using back substitution:

\[ i_3 = 2, \quad i_2 = 4 \quad \& \quad i_1 = 2. \]
Eigenvalues are the solutions to the characteristic equation:
\[ \det(A - \lambda I) = 0 \]
\[ \det \begin{pmatrix} 2 - \lambda & -1 & 0 \\ -1 & 2 - \lambda & -1 \\ 0 & -1 & 2 - \lambda \end{pmatrix} = 0 \]
\[ \iff (2 - \lambda)(2 - \lambda)^2 - 1 + (-1)(2 - \lambda) = 0 \]
\[ \iff (2 - \lambda)(\lambda^2 - 4\lambda + 2) = 0 \]
Hence \( \lambda = 2 \) or \( \lambda^2 - 4\lambda + 2 = 0 \)
\[ \iff \lambda = \frac{4 \pm \sqrt{16 - 8}}{2} = 2 \pm \sqrt{2} \]
Hence the eigenvalues of \( A \) are \( \lambda_1 = 2, \lambda_2 = 2 + \sqrt{2}, \lambda_3 = 2 - \sqrt{2} \).
For $\lambda = 2$, $(A - \lambda I)x = 0$

\[
\begin{pmatrix}
2 - \lambda & -1 & 0 \\
-1 & 2 - \lambda & -1 \\
0 & -1 & 2 - \lambda
\end{pmatrix}
\begin{pmatrix}
x_1 \\
x_2 \\
x_3
\end{pmatrix}
= 
\begin{pmatrix}
0 \\
0 \\
0
\end{pmatrix}
\]

\[
\begin{cases}
-x_2 = 0 \\
-x_1 - x_3 = 0 \\
-x_2 = 0
\end{cases}
\]

\[
x_2 = 0 \text{ and } x_3 = -x_1.
\]

Hence, every corresponding to $\lambda = 2$ is

\[
x = \alpha \begin{pmatrix}
1 \\
0 \\
-1
\end{pmatrix}
\text{ for arbitrary } \alpha \neq 0.
\]
EXAMINATION QUESTIONS/SOLUTIONS  SESSION 2002/2003

Setters are advised that Checkers, Editors, Typists and External Examiners greatly appreciate the merits of accuracy, legibility and neatness.

Write on this side only, between the margins, double-spaced. Not more than one question or solution per sheet, please.

(a) \( |\theta| \ll 1 \implies \sin \theta \approx \theta \)

Equate the tangential forces in each pendulum

\[
m l \ddot{\theta}_1 = -mg \theta_1 + kl (\theta_2 - \theta_1)
\]

\[
m l \ddot{\theta}_2 = -mg \theta_2 - kl (\theta_2 - \theta_1)
\]

\[
\text{mass} \times \text{tangential force due to gravity} \quad \text{force due to spring}
\]

\[
\implies \quad \ddot{\mathbf{r}} = \mathbf{A} \mathbf{r}
\]

with \( \mathbf{A} = \begin{pmatrix} -g/l & -k/m \\ k/m & -g/l & -k/m \end{pmatrix} \)

and \( \mathbf{r} = \begin{pmatrix} \theta_1 \\ \theta_2 \end{pmatrix} \). With \( l=10 \), \( m=1 \), \( k=1 \),

\[ g=10 \implies \mathbf{A} = \begin{pmatrix} -2 & 1 \\ 1 & -2 \end{pmatrix} \]

(b) Looking for a solution of the form \( \mathbf{r} = \mathbf{C} e^{i \omega t} \),

\[
\implies (i \omega)^2 \mathbf{C} e^{i \omega t} = \mathbf{A} \mathbf{C} e^{i \omega t}
\]

\[
\implies (\mathbf{A} + \omega^2 \mathbf{I}) \mathbf{C} = \mathbf{0}.
\]

Eigenvalues are given by the characteristic equation

\[
\det (\mathbf{A} + \omega^2 \mathbf{I}) = 0
\]
